Such is the narrative of Genesis, upon which the doctrine of the F. is based. The doctrine assumes various forms, according to the interpretation which the narrative receives. Some theologians interpret the narrative more literally—although none can be said to do so quite literally—and others interpret it more figuratively; while others reject it altogether as a narrative, and look upon it merely as a mythical story of the early time—mirroring the lapse from a primitive golden age, or age of innocence.

1. Even the most orthodox theologians so far spiritualize the narrative, or regard it figuratively. The serpent, for example, is with them the devil, although the text in Genesis itself gives no hint of such an interpretation. The enmity between the serpent and the woman is the enmity between the devil and mankind; and the bruising of the head and the heel is supposed to represent the victorious conquest—although not without wounds and bruises—of Jesus Christ, as the Messiah, over the devil. The doctrine of

the F., according to the most common mode of interpretation, may be stated in the following terms: "Our first parents being seduced by the subtlety and temptation of Satan, sinned in eating the forbidden fruit. By this sin, they fell from their original righteousness and communion with God, and so became dead in sin, and wholly defiled in all the faculties and parts of soul and body. They being the root of all mankind, the guilt of this sin was imputed, and the same death in sin and corrupted nature conveyed to all their posterity, descending from them by ordinary generation."—*Westminster Confession of Faith*, c. vi. The F., in this view, is the temptation of our first parents to eat by the devil, and the inheritance of this act by their natural descendants. This may be said to be the orthodox doctrine of the Christian church.

2. Other theologians consider the third chapter of Genesis to be in the main allegorical—representing a picture of the violence of appetite in our first parents. In this view, the serpent is a mere imaginary accessory—the emblem of temptation; the supposed interview between God and our first parents is of the same character—the emblem of the voice of conscience following unlawful indulgence; the tree of the knowledge of good and evil represents some form of sensual indulgence. The only realities in the picture are the moral realities, conscience and temptation in some carnal form—realities which were no more powerful in the case of our first parents than they are in the case of all their descendants who yield to unlawful indulgence, as they did. The doctrine of the F., according to this interpretation, is simply the doctrine of the abuse of free will in our first parents; and the question of the relation of this primary sin to all subsequent sin, is variously regarded by this class of theologians. All of them would repudiate any formal imputation of it; yet all or most allow some actual transmission or inheritance of corrupted will, as the consequence of the original abuse of it.

The Pelagian theory maintained, indeed, that the race was not the worse of Adam's fall; but that, as our first parents "were to blame for yielding to a temptation which they might have resisted, so all of us, by a proper attention in cultivating our natural powers, may maintain our innocence amidst the temptations with which we are surrounded; and, therefore, that we fall short of that which it is in our power to do, if we do not yield a more perfect obedience to the law of God than Adam yielded." The Arminian theory, again, contended that the chief loss of the race, as the consequence of the transgression of our first parents, was the subjection to death thereby incurred, and the moral disadvantages arising out of the fear of death. Others, more orthodox than either, contend that the spiritual unity of the race necessarily implies that the depraved will of our first parents has descended to their posterity as their unhappy portion.

3. The opinion of those who look upon the chapter in Genesis as a mere myth or fable, representing a dream of the religious imagination, without any special moral meaning, cannot be said to come within the pale of Christian theology. The doctrine of the F. is with them only a devout idea, inconsistent with their principles of philosophy and history, and which, accordingly, they dismiss from their speculation or concern altogether.

FALLACY. The incorrect performance of the process of reasoning, so as to lead to error, is said to be a fallacy. The science of logic reduces sound reasoning to certain rules, and when any of these rules is violated, a logical fallacy is the result. There is always included in logical treatises a chapter on fallacies, in which the several kinds are classified and illustrated. In the old writers, there was always a division into two classes, according as the error lay in the *form* of the reasoning, or in the *matter;* the formal were entitled *in dictione*, or those appearing in the expression; the material were entitled *extra dictionem*, implying that the fault could not be detected from the language, but must be sought in a consideration of the meaning or subject-matter. As some of the designations employed in detailing these various kinds of erroneous reasoning have passed into common use, we shall first give a short notice of the ancient classification.

The formal, or those *in dictione*, were direct breaches of the laws of syllogism, or of argumentation from premises.

The fallacy of *undistributed middle* is one of the cases where what is called the middle term of a syllogism is used in two senses. "A term is said to be 'distributed' when it is taken universally, so as to stand for everything it is capable of being applied to; and, consequently, is 'undistributed' when it stands for a portion only of the things designated by it. Thus, 'all food,' or every kind of food, are expressions which imply the distribution of the term 'food;' 'some food,' would imply its non-distribution." In such a proposition as "all food is obtained from the vegetable or animal kingdoms," the term is distributed, because it is meant to be affirmed of every article used as food, that such article is derived from one or other of these two sources. But when we say "food is necessary for life," we mean only a limited number of articles. Hence such a syllogism as the following: "Food is necessary to life; corn is food; therefore, corn is necessary to life," is faulty from undistributed middle; the major proposition, "food is necessary," etc., has the form of a universal proposition, with the reality of a particular one.

The *æquivocatio*, or *ambiguous middle*, is the case where a word is used in two senses so different as to give properly no middle term, and, therefore, no connecting link

between the premises and the conclusion. A favorite example of this is the following: "Every dog runs on four legs; Sirius (the dog-star) is a dog; therefore Sirius runs on four legs." This is merely playing with the ambiguity of a word. Dr. Whately has shown that this fallacy may often arise with words derived from the same root, but acquiring from usage different significations; thus, "projectors are unfit to be trusted; this man has formed a *project*, therefore he is unfit to be trusted;" where the argument supposes that the meaning of "projector" and "one who has formed a project" is the same, which it is not.

The fallacy of *composition and division* arises by using a word distributively that is meant collectively; thus, "five is equal to two and three; two and three are even and odd; therefore five is even and odd."

"The fallacy of *accent* was an ambiguity arising from pronunciation. Thus, by a false accent in reading the commandment, "thou shalt not bear false witness against thy neighbor," it might be suggested that subornation is not forbidden, or that anything false except evidence is permitted, or that false evidence may be given *for* him, or that it is only against neighbors that false witness is not to be borne."

The *fallacia accidentis* is still a form of the ambiguous middle. It is when we conclude of a thing something that is only true of it accidentally, as, "wine is pernicious, therefore it ought to be forbidden." The premise is true only of the immoderate use; the conclusion refers to its use in every form. Another fallacy, the converse of this, is arguing *à dicto secundum quid ad dictum simpliciter* (passing from what is true in some respect to what is true absolutely). Of this the stock example is: "What you bought yesterday you eat to-day; you bought raw meat yesterday, therefore you eat raw meat to-day."

The most usually quoted of the second class of fallacies—*extra dictionem*—are the following:

Ignoratio elenchi, or "ignorance of the refutation." This means mistaking the point in dispute; or proving something that an opponent does not deny. This is common enough in controversy. See an example in point in ETHICS.

The *petitio principii*, or "begging of the question." This is when, instead of proving a position by some different position, something is assumed that is identical with what is to be proved. The most common form of this fallacy is what is termed *reasoning in a circle*, where we make two propositions mutually prove each other. The following would be an example of this mode of reasoning. Suppose we asked why smoke ascends, and any one were to answer, "because it is light;" we then inquire how it is known to be light, and the reply is, "because it ascends."

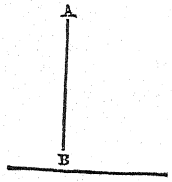
The *non causa pro causa*. This is a fallacy of insufficient induction, or the inferring a connection of cause and effect where there is only a mere sequence or accompaniment: as when we allege that the prosperity of England is due to its having an aristocracy, or an established church, or any other circumstance that has attached to the country, without ascertaining that there is any real causation between the two facts. Empiricism in medicine is of this nature; such a one took a certain medicine, and recovered from an illness, therefore the medicine was the cause of the recovery. The *post hoc, ergo propter hoc*, is another expression for the same fallacy, which is one of wide range, and whose rectification far transcends the limits of scholastic or formal logic.

The *argumentum ad hominem* is a reference to the circumstances of the party addressed, and means that although a certain reasoning may be good in itself, such party is not entitled to urge it, having perhaps already repudiated the same reasoning in other cases, or acted in a manner inconsistent with the employment of it. (For a full exemplification of fallacies according to the foregoing enumeration, see De Morgan's *Formal Logic*, Whately's *Logic*, sir William Hamilton's *Lectures on Logic*, etc.)

The subject of fallacies has received a much more comprehensive treatment in the work on logic by Mr J. S. Mill, who has enlarged the basis of the science itself, by placing induction at the foundation of reasoning, and by recognizing the necessity of laying down rules for the correct performance of that process. See INDUCTION. This enables him to give a proper place to some of the preceding fallacies, such as the *post hoc, ergo propter hoc*, which, although occurring in treatises of syllogistic logic, does not violate any rule either of syllogism or of any process included in such treatises. In fact, if we take a complete view of all the cardinal operations that enter into the establishment of truth by evidence, we ought to enumerate four such operations—Observation, including experiment; definition, or the right use of general terms; induction; and deduction or syllogism. Now, any one of these operations badly performed would necessarily lead to a wrong result, in other words, a fallacy. But in addition to the mistakes arising from the admission of insufficient evidence at any point, there is a class of errors (as well as truths) that arise from our receiving propositions without any evidence at all, on the ground that they are self-evident. In every case of reasoning, we must come at last to something that does not need a reason, as, for example, the evidence of our senses, or our actual observation; but we may sometimes admit as self-evident what is really not so, owing, perhaps, to our having a strong sentiment in the matter on hand. It is usual to consider the existence of an external material world, altgether independent of our minds, as certain in itself without requiring any proof or reason for the belief. It is found that we often commit mistakes in this way, and the mistakes thence

arising Mr. Mill illustrates under the title of fallacies of simple inspection, or fallacies *à priori*, which includes the whole of what may be termed natural prejudices. The other members of his classification follow his division of the processes concerned in the investigation of truth: they are fallacies of observation, fallacies of generalization, including induction, and fallacies of ratiocination or syllogism. He remarks, moreover, that error does not often take the form of a deliberate infringement of the rules of good observation, induction, or deduction, but rather consists in a confused perception of the premises involved. In other words, it is the "not conceiving our premises with due clearness, that is, with due fixity; forming one conception of our evidence when we collect or receive it, and another when we make use of it; or unadvisedly, and in general unconsciously, substituting, as we proceed, different premises in the place of those with which we set out, or a different conclusion for that which we undertook to prove. This gives existence to a class of fallacies which may be justly called fallacies of confusion; comprehending, among others, all those which have their source in language, whether arising from the vagueness or ambiguity of our terms, or from casual associations with them." It is in this group that Mr. Mill places the *petitio principii*, the *ignoratio elenchi*, and ambiguous language generally (*Logic*, book v.).

The scholastic fallacies were considered mostly in the light of weaknesses or involuntary errors of the intellect, to be corrected by sound rules or a good method of procedure. The syllogistic logician made little count of the natural prejudices, or strong emotions and passions of mind, which forcibly pervert the intellectual views, and render men averse to sound reasoning. This grand omission was first effectively supplied in the immortal first book of the *Novum Organon* of Bacon, who, in a vigorous and telling exposition, set forth some of the most powerful prejudices of the natural mind, and their influence in corrupting science and philosophy, as well the every-day judgments of mankind. Under the name of "idola" he classed four different species of these moral sources of error, against which the mind had to be fortified, not by syllogistic rules, but by a self-denying discipline, and a highly cultivated perception of the true end of science, which was to increase human power in all the arts of life. His first class of idola were *idola tribus*, or delusions common to the human mind generally, such as errors of the senses, the over-susceptibility of the mind to impressions of sense, the limits of the human faculties, and the interference of prejudices and passions; a very comprehensive class, which even he has failed to do full justice to. The next class are *idola specûs*, idols of the den or cavern, by which he understands the peculiarities and idiosyncrasies of individuals. The third class, *idola fori*, idols of the market, are intended to include the abuses of language, or the various ways that our conceptions of things are distorted by names. The last class are the *idola theatri*, theatrical illusions, under which he rebukes the great system-builders of antiquity, such as Aristotle, for introducing fanciful and irrelevant considerations into philosophy; and dwells especially on the corrupting influences of superstition and theology, and also the poetical tendencies of the mind, which are not satisfied with truth unless it can take on in addition a certain warmth or brilliancy of coloring.



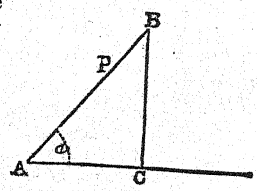
FALLING BODIES. Owing to gravity (q.v.), all terrestrial bodies, if unsupported, *fall*, or move towards the earth's center. When a falling body is absolutely without support, it is said to fall freely, as distinguished from one descending an inclined plane or curved surface. We shall here consider the two cases of free descent and of descent on inclined planes.

1. *Bodies falling freely.*—The first fact of observation regarding falling bodies is that they fall with a variable velocity; from this we infer that they are acted upon by some force. Again, on observing how the velocity varies, we find that its increments in equal times are equal; from this we conclude that gravity is a uniform force, which it is, at least sensibly, for small distances above the earth's surface. We have next to find a measure for this force. By experiment it is found that a body in 1″ falls through 16.1 ft., and that at the end of 1″ it moves with such a velocity, that if it continued to move uniformly after the 1″ expired, it would pass over 32.2 ft. in the next second. Hence 32.2 ft. is the measure of the velocity which has been generated in 1″, and is therefore the measure of the accelerating force of gravity; for the measure of accelerating force is the velocity which it will produce in a body in a second of time. The quantity 32.2 ft. is usually denoted by the letter g; and it is proper to mention here that this quantity measures the accelerating force of the earth's attraction on all bodies. Experiment shows that under the exhausted receiver of an air-pump all bodies fall with equal rapidity, and that the difference of velocities of falling bodies in air is due entirely to the action of air upon them.

As the accelerating force is uniform, it follows that the velocity generated in any time, t, will be given by the formula $v=gt$. Since the force is uniform, it must generate an equal velocity every second. In t'', therefore, it must generate a velocity gt, since it produces g in 1″. In 2″, a falling body will be moving with a velocity of 64.4 ft.—i.e., were the velocity to become constant for the third second, it would in that second move through 64.4 feet.

We are now in a position to inquire more particularly how bodies fall, and to answer such questions as first: What time will a body falling freely take to fall through a given

space? Second: What velocity will it gain in falling through a given space? Third: How high will a body ascent when projected straight up with a given velocity? etc.



Let A be the point from which a body falls, and B its position at the end of the time t; and let AB = S. Then we know that at B the body has the velocity gt. Suppose, now, the body to be projected upwards from B towards A with this velocity gt—gravity acting against it, and tending to retard its motion. We know that at the end of a time t it will be again at A, having exactly retraced its course, and lost all the velocity with which it started from B, because gravity will just take the same time to destroy the velocity gt which it took to produce it. From this consideration we may obtain an expression for the space AB or S in terms of the time t. In the time t, the body rising from B with a velocity $= gt$ would ascend, if not retarded, a height ($\frac{gt}{2}$. t, or $\frac{gt^2}{2}$. But in the time t, gravity, we know, carried it through S; it will therefore, in the same time, by retarding it, prevent it going to the height $\frac{gt^2}{2}$ by a space = S. The space through which it actually ascends is then represented by the difference $\frac{gt^2}{2}-S$; but this space we know to be AB or S. Therefore $S = \frac{gt^2}{2}-S$; or $2S = \frac{gt^2}{2}$, or $S = \frac{1}{4}gt^2$. We may give this equation another form. For v being the velocity acquired in the time t, $v = gt$, $\therefore t = \frac{v}{g}$. Then $S = \frac{1}{2}g.\frac{v^2}{g^2} = \frac{v^2}{2g}$. Hence $v^2 = 2gS$. From these formulæ, we see that when a body falls from rest under the action of gravity, its velocity at any time varies as the time, and the square of its velocity as the space described.

If the body, instead of starting from rest, has an initial velocity V; and if v, as before, be the velocity at the time t, then evidently v is = the original velocity + that which is generated by gravity, or $v = V + gt$; and the space will be that which would have been described by the body moving uniformly with a velocity V + that which it would describe under gravity alone, or $S = Vt + \frac{gt^2}{2}$. With regard to the last two formulæ, it is easy to see that they may be made to suit the case of a body projected upwards with a velocity V, by a change of signs; thus, $v = V - ft$, and $S = Vt - \frac{gt^2}{2}$; gravity here acting to destroy velocity, and diminish the height attained. From the general formulæ in the case of an initial velocity, whether the body be projected upwards or downwards, we may express v in terms of S, as we did in the case of motion from rest. For $v^2 = (V \pm gt)^2 = V^2 \pm 2g(Vt + \frac{gt^2}{2}) = V^2 \pm 2gS$.

These are all the formulas applicable to the case of falling bodies, and by their means all problems in this branch of dynamics may be solved. It also appears that the formulæ above investigated apply to all cases of rectilinear motion of bodies considered as particles under the action of any uniform force. In all such cases, if f measure the accelerating force $S = \frac{1}{2}ft^2$, $v^2 = 2fS$, for the case of motion from rest; and $S = Vt \pm \frac{1}{2}ft^2$, and $v^2 = V^2 \pm 2fS$, for the case of an initial velocity.

The reader can easily frame examples illustrative of the formulæ for himself. We subjoin one: A stone falls down a well, and in 2″ the sound of its striking the bottom is heard. How deep is the well? Neglecting the time occupied in the transmission of sound, the formula $S = \frac{1}{2}gt^2$ applies, or S = depth = $\frac{1}{2}g$. 2^2, t being 2″; $\therefore$ depth = $2g$, or 64.4 feet.

2. *Bodies descending inclined planes.* In this case the formulas already investigated apply with a slight change. In the figure, if P be a body on the inclined plane AB, descending under gravity, we observe that only that resolved part of gravity parallel to AB is effective to make it descend, the other part at right angles to AB merely producing pressure on the plane. The angle of inclination of the plane being a, we know (see COMPOSITION AND RESOLUTION OF FORCES) that the resolved part of gravity parallel to the plane is g sin. a. The body, then, may be conceived to be descending under a uniform accelerating force g sin. a. We obtain the formulæ, accordingly, for descent on inclined planes by substituting g sin. a for f in the general formulæ given above. We notice, however, that in descent on inclined planes the velocity acquired is, as in the case of bodies falling freely, due solely to the vertical height through which the body falls. By our formula, $v^2 = 2g$ sin. a. S, where S, = AB, if the body falls from B. This may be written $v^2 = 2g$. S. sin. a, or = $2g$. AB. sin. a, or = $2g$. BC, since AB. sin. a = BC. But this is the same as the velocity acquired by a body in falling freely through BC. In fact, it holds generally true, that the velocity acquired by a body falling down the surface of any smooth curve is that due to the vertical height through which it has fallen; which might be proved in various ways, but is sufficiently clear from this, that any curve may be considered as a succession of inclined planes, indefinitely short in length, and great in number; for the proposition being true, as above proved, for each of them, will be true for all, and therefore for the curve.

For an account of the variations of the value of *g*, due to the earth not being a perfect sphere, and other causes, see EARTH. The reader is also referred to the article ATWOOD'S MACHINE. The theory of the descent of bodies under gravity was first discovered and taught by Galileo.

FALLING SICKNESS. See EPILEPSY.

FALLING STARS. See METEORS, *ante*.

FALL OF THE LEAF. See DECIDUOUS TREES and LEAVES.

FALLMERAY'ER, JACOB PHILIPP, a German traveler and historian, was b. 10th Dec., 1791, at Tschotsch, near Brixen in the Tyrol; studied at Brixen, and in 1809 went to Salzburg, where he gave instructions to pupils in history and Latin. At the university of Landshut, he studied law, history, and philology. When Germany rose against Napoleon in 1813, he entered the Bavarian army, and took part in several engagements. After peace was concluded, F. returned to his studies. In 1826, he was appointed to the chair of history and philology at Landshut. In 1831, he accompanied the Russian gen., count Ostermann-Tolstoy, in a journey to the east, visiting Egypt, Palestine, Syria, Cyprus, Rhodes, Greece, Turkey, and Italy. During 1830–40, he resided with count Ostermann-Tolstoy at Geneva, and in the course of the next eight years twice revisited the east. The events of 1848 recalled him to Bavaria, and for a short time he sat as a deputy to the Frankfort parliament, but after 1850, he lived privately in Munich. F. was a distinguished polyglott, and spoke a great number both of European and oriental tongues. His principal works are *Geschichte des Kaiserthums Trapezunt* (Münch. 1831); *Geschichte der Halbinsel Morea in Mittelalter* (2 vols., Stuttg. 1830–36); and *Fragmente aus dem Orient* (2 vols., Stuttg. 1845). His views on the origin of the modern Greek language have excited the liveliest controversy both in Greece and elsewhere. A complete edition of F.'s works appeared at Leipsic in 1861, entitled *Gesammelte Werke von Jakob Phillipp Fallmerayer*. He died in 1862.

FALLO'PIAN TUBES, THE (so called after Fallopius, who is usually, but incorrectly, regarded as their discoverer), or oviducts, are canals about 4 or 5 in. in length in the human subject, opening at their inner extremity into the upper angle of the uterus or womb, and at the other end, by a fringed funnel-shaped termination, into the cavity of the peritoneum. This fringed or fimbriated extremity at certain periods grasps the ovary, and receives the ovum, which is discharged by the rupture of the Graafian vesicle. See OVARIES. The ovum usually passes along the F. T. into the uterus, where it is either impregnated by contact with one or more spermatozoa, or is absorbed. Sometimes, however, the ovum becomes not only impregnated but retained, and further developed in the F. T., thus giving rise to one of the forms of extra-uterine pregnancy.

FALLO'PIUS, GABRIEL, a celebrated anatomist, b. at or near Modena, about the year 1523 (this date, however, is very uncertain), and died in 1562. If the date we have assigned is correct, he was only 25 when he was promoted from the university of Ferrara to a professorship at Piza, whence, after a few years, he was called to Padua, to succeed Vesalius, who had been compelled by the inquisition to resign his office. See VESALIUS. Cuvier characterizes him as one of the three *savants* who restored rather than created the science of anatomy in the 17th c., the two others being Vesalius and Eustachius. After a short but brilliant career, he died at the age of 40, and was succeeded by his favorite pupil, Fabricius ab Acquapendente.

He published numerous works in various departments of medicine, of which the most important is his *Observationes Anatomicæ, in libros quinque digestæ*, 1561, in which he corrects many errors into which his predecessor, Vesalius, had fallen. He was the first to describe with accuracy the ethmoid and sphenoid bones, and the minute structure of the ear (the canal along which the facial nerve passes, after leaving the auditory, is still known as the aqueduct of F.); the muscles of the soft palate, and the villi and valvulæ conniventes of the small intestine. In some of his supposed discoveries, he had been long anticipated; for example, the tubes passing from the ovary on either side to the uterus, and which bear his name, were known to, and accurately described by, Herophilus and Rufus of Ephesus, 300 years before our era. In addition to his anatomical fame, he had a considerable reputation as a botanist. He was the superintendent of the botanical garden at Padua; and a genus of plants, *Fallopia*, has been named after him. A complete edition of his works, in four folio volumes, was published in 1600.

FALLOUX, FRÉDERIC ALFRED PIERRE, Comte de, a French author and statesman, was b. at Angers, 11th May, 1811. His family was distinguished for its legitimist zeal, and at the restoration was rewarded by receiving letters of nobility. Young F. first drew attention to himself by two works penetrated by an ardent love of the old Bourbon order of things—*L'Histoire de Louis XVI.* (Paris, 1840), and *L'Histoire de Saint Pie V., Pape, de l'Ordre des Frères prêcheurs* (Paris, 1844). These indicate the level of his political and religious faith. In the elections of 1846, he was chosen deputy for the department Maine-et-Loire. In religion, he advocated the ideas of Montalembert; in politics, those of Berryer, but united with his legitimist sentiments a love of liberty and education strangely incongruous with the historic character of his party. After the revolution of Feb., 1848, he exhibited much energy as a member of the constituent assembly, was

one of those who organized the resistance to the insurrection of the 15th May, and, as reporter on the national workshops, pronounced for their immediate dissolution. He was also one of the most ardent promoters of the expedition to Rome. After the election of Louis Napoleon to the presidency, F. was appointed minister of public instruction, an office which he held only for ten months. After the events of the 2d Dec., 1851, he retired from public life to a country-seat near Angers, where he occupies himself with agricultural pursuits. In 1857, he was admitted a member of the French academy, and in the same year published at Tours his *Souvenirs de Charité*. He published in 1859 *Mme. Swetchine, sa Vie et ses Œuvres;* in 1863, *Méditations et Prières;* in 1864, *La Convention du 15 Septembre;* in 1865, *Itinéraire de Turin à Rome;* and in 1866, *Lettres inédites de Mme. Swetchine.* In 1869, he attempted to re-enter the assembly for the 3d circonscription of La Vendée, but was defeated by the official nominee.

FALLOW (from the same root as Ger. *fahl* or *falb*, Lat. *fulvus*, expressing a pale dun, tawny color). This word sometimes signifies waste, untilled land; but usually it is applied to land that is plowed and otherwise stirred, for a season without being cropped. The most of the wheat raised by the Romans was sown after the land was fallowed; indeed, the usual rotation was fallow and wheat alternately. It was only fertile soils that could long support such an exhausting system; hence resulted the decreasing produce which the later Roman agricultural authors so often speak of and lament.

The fallowing of land was introduced into all the countries which fell under the dominion of the Romans. During their sway in Britain, it soon exported large quantities of wheat; and for centuries after the Romans left it, no other mode of cultivating the land was followed. It may here be observed, that wherever the system of fallowing, without giving manure to the crops, is practiced, it necessarily supposes that the soil is at least moderately fertile. This system is most successful on argillaceous soils, which are retentive of organic manure. It must be borne in mind that the chief use of fallow is to liberate the plant-food which is already stored up in the soil as organic matter. The plowing and stirring, by admitting air, promotes decomposition, in the same manner as the turning over of a dunghill does; it also destroys the roots of the weeds that impoverish and choke the crops.

It was long before fallowing was introduced to any extent in Scotland; but about the beginning of the present century, it was largely practiced. Owing, however, to the draining of the soil, and the extension of the green-cropping system, it is now confined to the most retentive clay-soils, where it affords the only means of thoroughly cleaning the land. In a rotation of beans, clover, oats, fallow, wheat, and barley, each field is subjected to a process of fallowing once in every six, seven, or eight years, according to circumstances.

Fallow-fields usually receive a deep furrow in autumn. Lying exposed through the winter, the frost pulverizes the surface. In spring, when the weather becomes dry, the cultivator or the plow opens up the soil, and the process of extirpating the weeds goes on. Sometimes as many as three or four furrows are given in summer before the seed is sown in autumn. In old cultivated countries, land is commonly so much reduced in its organic matter, that fallows receive dressings of farm-yard manure, rape-dust, or guano, to obtain fertility.

Since the general introduction of green crops, the term fallow has departed in some measure from its original meaning. These crops are sown on what was formerly the fallow-break, and are now often styled fallow-crops. The land, no doubt, receives in some measure a fallowing, as the green crops are cultivated by the plow during their growth. Bastard-fallowing is a term which is used in Scotland when hay-stubble is plowed up in the end of summer, freed from weeds, and sown with wheat in autumn.

Where no express stipulation on the subject has been introduced into the lease, it has been held in Scotland, that, as the outgoing tenant might have taken a crop from the land, which, in accordance with the most approved principles of agriculture, he ought to leave fallow, and as the incoming tenant reaps the advantage in case of his abstaining from doing so, he is entitled to claim its value (Purves, Dec. 3, 1822. See Bell's *Principles*, s. 1263). "This decision," says Mr. Hunter (*Landlord and Tenant*, ii. p. 458), "has been deemed to have fixed the law." In conformity with the same principle, it has been ruled, that if the outgoing tenant received prepared fallow, the like should be left by him. A tenant who, on entering to his farm, had received a certain extent of fallow, prepared with manure, free of expense, was held bound to leave the same amount of fallow and manure as he had received, and to be entitled to claim payment only for the surplus (Brown *v.* College of St. Andrews, 11th July, 1851). But where a portion of land has been expressly reserved in the lease for fallow and green crop, for which the tenant was to receive merely a certain sum per acre for plowing, the rights of the parties are settled by the contract, and the tenant can claim no additional sum for fallow (Sheriff *v.* Lord Lovat, 13th Dec., 1854).

FALLOW CHAT. See WHEATEAR.

FALLOW DEER (*Dama vulgaris* or *Cervus Dama*), a species of deer well known in Britain, being very commonly kept in *parks*, as it is also in most parts of Europe. It is probably a native of the countries around the Mediterranean, and has been introduced by man into the more northern parts of Europe, where it is, however, now in some

places to be found wild in forests. It is doubted whether it has not been introduced by man, at a remote period, from the n. of Africa even into the s. of Europe, in all parts of which it is now at least completely naturalized. How far its geographic range extends eastward, is not very certainly known. It is represented in the sculptures of Nineveh. Its introduction into Britain is ascribed to James VI. of Scotland, who is said to have brought it from Norway when he brought home his queen, Anne of Denmark, and after his accession to the English throne, to have transported it to Enfield and Epping. Thousands of F. D. now exist in some of the English parks. They generally receive some attention and supplies of fodder in winter.

In size, the F. D. is smaller than the stag or red deer, from which it also differs in its broad palmated antlers, its longer tail, and its smoother and finer hair. In color, it is generally yellowish-brown in summer; darker, or even blackish-brown in winter; more or less spotted with pale spots, particularly in summer and when young; but in one variety the spots are very marked; in another they are not to be observed even in the young. The buttocks are white, and a dark line passes along the back. White F. D. are sometimes to be seen. The female has no horns. The male is called a BUCK (Fr. *daim*), the female a DOE (Fr. *daime*), the young a FAWN (Fr. *faon*). The name F. D. is derived from its color. See the article FALLOW, in agriculture. When the F. D. and red deer are kept in the same park, the herds seldom mingle, nor do hybrids occur. The F. D. loves the woods. The flesh of the F. D. is one of the most esteemed kinds of venison. The remains of fossil species nearly allied to the F. D. occur in some parts of Europe. The great fossil Irish *Elk* (q.v.) is allied to it.

FALL RIVER, a remarkable stream of Massachusetts, in the United States, is only about two m. long. Throughout nearly the whole of its course it tumbles between lofty banks over a rocky bottom, descending in its last half mile fully 130 feet. This lower section of the torrent is literally crowded with mills, which scarcely leave room for air and light between each other. The mouth is on the eastern arm of Narraganset bay. F. R. is the name likewise of the adjacent locality. The city of F. R. contains, '70, 26,766 inhabitants, who are chiefly employed in connection with the water-power already mentioned. The principal manufactures are woolens, cottons, and ironware. F. R. contains more spindles than any other city in the United States. It has an excellent harbor.

FALL RIVER (*ante*), a city and port of entry in Bristol co., Mass., near the boundary of Rhode Island, at the mouth of Taunton river where it falls into Mount Hope bay, 49 m. s. of Boston, reached by the Old Colony, the Providence, Warren, and Fall River, and the Fall River and New Bedford railroads; pop. '75, 45,340. It has more than 40 cotton mills, running nearly 1,300,000 spindles, and employing about $15,000,000 in capital. There are also other important manufactures; a city library, about 20 churches, banks, etc. It was once a part of Freetown, and was incorporated separately in 1803. A few years later it was called Troy, but the first name was restored in 1834. The city charter dates from 1854. It has risen to be one of the most important manufacturing centers in the country. A line of large and splendid steamboats connects it with New York.

FALLS, a co., in central Texas, on Brazos river, intersected by the Waco branch of the Houston and Texas Central railroad; 795 sq.m.; pop. '70, 9,851—4,681 colored. The surface is hilly or rolling prairie, partly covered with forests of ash, cedar, oak, etc. The soil is fertile; chief products, cotton, corn, and cattle. Co. seat, Marlin.

FALMOUTH, a parliamentary and municipal borough and seaport in the s.w. of Cornwall, on a w. branch of the estuary of the Fal, 14 m. n.n.e. of Lizard point, and 269 m. w.s.w. of London. It chiefly consists of a narrow street, a m. long, on the s.w. of the harbor, and of beautiful suburban terraces and villas on the heights behind. The harbor, one of the best in England, is formed by the estuary of the Fal, which is 5 by 1 to 2 m. in extent. It is 12 to 18 fathoms deep, and affords shelter to 500 vessels at a time. The mouth is defended on the w. by Pendennis castle, situated on a rock 198 ft. high, and which resisted a siege by Cromwell for six months; on the e. by Mawes castle, both built by Henry VIII. Pop. of the mun. bor. '71, 5,294; of the parl. bor., which includes Penrhyn, and returns two members, 16,819. F. was, till recently, one of the principal packet-stations for foreign mails. In 1876 the entries inwards were 956 vessels, of 142,175 tons; and the clearances outwards 554 vessels, of 48,605 tons. There is a great pilchard-fishery off the neighboring coasts. The chief exports are tin, copper, pilchards, and fuel. Here orange and lemon trees yield plenty of fruit on open garden-walls. F. arose in the middle of the 17th c., sir Walter Raleigh having at an earlier period drawn public notice to its capabilities; and it has been, since that time, a rendezvous for fleets and mail-packets proceeding abroad.

FALMOUTH, a township in Barnstable co., Mass., on Buzzard's bay, and Vineyard sound, noted for the important harbor of Wood's hole, now called Wood's holl, and becoming popular as a watering-place. Pop. of township, '70, 2,237.

FALSE, RULE OF, or FALSE POSITION, is a mode of reckoning, in cases where a direct solution of the question is impracticable. Any number is chosen at hazard, as that which is sought; this *false position* of course gives a false result, and from the

amount of the error, it is ascerained by proportion what the assumption ought to have been. *Ex.* what number is that whose half exceeds its third by 12? Assume 96 at random; 48—32 gives 16, which is too great; ∴ 16 : 12 :: 96 : 72, the number required. This method is now mostly superseded by the use of equations.

FALSE BAY, an inlet which may be referred either to the Atlantic, the Southern, or the Indian ocean. It washes the e. side of the mountainous district of s. Africa, which terminates in the cape of Good Hope, and extends eastward along the coast as far as False cape, measuring about 22 m. in length, and about the same in breadth. F. B. is, of course, sheltered from the n.w. monsoon, to which Table bay—the harbor of Cape Town—is exposed, an advantage which is more especially possessed by Simon's bay at its n.w. extremity. Hence, besides periodically receiving trading-vessels from Cape Town for temporary protection, it is permanently the station of the naval force of the colony.

FALSEHOOD. See FRAUD.

FALSE IMPRISONMENT. Every confinement of the person is an imprisonment, whether it be in a common prison or a private house, or in the stocks, or even by forcibly detaining one in the public streets (Coke, *Inst.* ii. 482). A man is liable for detaining the person of another, not only without cause, but without legal cause. Thus, where a man gives another in charge for committing an offense, the former is liable to an action for F. I., if he fails to substantiate his cause. Police-officers, also, are liable for apprehending a man without a competent warrant, or without reasonable suspicion. But where a felony has been committed, an officer is entitled to arrest on suspicion. Not only constables but private persons may arrest a man who commits a felony in their presence. A person who has falsely imprisoned another is liable to a criminal prosecution, and also to a civil action. In the former case he may be punished by fine and imprisonment; in the latter, he must pay such damages as are awarded. Any one detained without sufficient cause is entitled to apply for a writ of *habeas corpus* (q.v.) to procure his liberation. In Scotland, this species of offense is called wrongous imprisonment.

FALSE NEWS or RUMORS. Spreading false news to make a discord between the sovereign and nobility, is a misdemeanor, and punishable by the common law of England with fine and imprisonment. By statute of Westminster the first, c. 34, this penalty is confirmed. This statute is said by lord Coke to have been passed in consequence of the rebellion of Simon de Montfort (Coke, *Inst.* ii. 226). The law before the conquest had been more severe, and required that the author and spreader of false rumors should have his tongue cut out, if he redeemed it not by estimation of his head (or capitation tax). One of the articles against cardinal Wolsey was founded on this principle of common law. "Also, the said cardinal has busied and endeavored himself by crafty and untrue tales against your nobles of your realm."—Coke, *Inst.* iv. 92. The feeling of the present day is more in accordance with the axiom of Tacitus, *Convicia, si irasceris, tua divulgas, spreta exolescunt* (If you seek to revenge slanders, you publish them as your own; if you despise them, they vanish).

FALSE POINT, a harbor in the Cuttack district of Orissa, one of the best on the coast of India; lat. 20° 20′ n., long. 86° 4′ e.; the anchorage is safe, roomy, and completely land-locked. It is a regular port of call for Anglo-Indian coasting steamers. There is a large export trade with Mauritius, and other French colonies.

FALSE AND PRETENDED PROPHECIES, with intent to disturb the public peace, are punishable by several old statutes. By 33 Henry VIII. c. 14, this crime is made a felony; but by 3 and 4 Ed. VI. c. 15, continued by 7 Ed VI. c. 11, and by 5 Eliz. c. 15, the punishment is restricted to one year's imprisonment and forfeiture of £10 for the first offense; and for the second offense, imprisonment for life, and forfeiture of all chattels. These statutes apply to a particular class of prophecies—viz., prophecies "upon or by the occasion of any arms, fields, beasts, badges, or such other like things accustomed in arms, cognizances, or signets; or upon or by reason of any time, year, or day, bloodshed, or war, to the intent to make rebellion," etc. This description refers to predictions founded upon the heraldic bearings of particular families, which, in the state of public feeling at the time when the statutes were passed, might have been productive of discontent and sedition. The statutes are unrepealed, but are not likely in the present day again to be put in force.

FALSE PRETENSES, OBTAINING MONEY BY. By the common law of England, a man is not punishable as a criminal who has induced another, by fraudulent representations to part with the property of money or goods, unless the loss occasioned by the deception be of a public nature. Larceny or theft was the only species of wrongful abstraction of articles of value which was recognized, and where the consent of the owner to the transaction was obtained, no matter how fraudulently, the loser was left to a civil action for his relief. To remedy this effect in the law, the 33 Henry VIII. c. 1 was passed, whereby it was enacted that if any person should falsely and deceitfully obtain any money, goods, etc., by means of any false token or counterfeit letter made in any other man's name, the offender should suffer any punishment short of death, at

the discretion of the judge. This statute, however, only reached the case of deception by use of a false writing or token; the 30 Geo. II. c. 24 was therefore passed for the purpose of including all false pretenses whatsoever. Further alterations were made by subsequent statutes, until, by 24 and 25 Vict. c. 96, the previous legislation on the subject was consolidated. This is now the ruling statute in regard to false pretenses. The general principle is that, wherever person fraudulently represents as an *existing fact* that which is not an existing fact, and so gets money, etc., that is an offense within the act (Reg. *v.* Woolley, i. Den. C. C. 559). The false pretense must relate to some present fact, and therefore a promise merely to do some act is not such a false representation as will sustain a conviction. It is not necessary that the deception should be by words or writing, but any act tending to deceive will bring a person within the statute. Thus, a man at Oxford wearing a cap and gown, in order to induce a tradesman, of whom he ordered goods, to believe that he was a member of the university, is sufficient to warrant a conviction. The deception practiced, however, must not be simply as to the *quality* of an article, for this is regarded as merely a dishonest trick of trade, and not criminally punishable; it is also necessary that the owner should be deceived by the pretense; and where a tradesman is induced to part with goods to a regular customer, making a false statement, not on account of the statement, but from his belief in the credit of the party, the transaction is not punishable under the act. By 24, 25 Vict. c. 96, ss. 88 to 90, it is enacted that it shall be no bar to a conviction that the crime, on being proved, amounts to larceny, and that it shall not be necessary to prove an intent to defraud any particular person; that the delivery of money, etc., to another person, for the benefit of the party using the deception, and also the obtaining signature to, or destruction of, a valuable security, etc., by a false representation, shall subject the offender to punishment. The same statute, ss. 46 and 47, contains a salutary provision, that any person attempting to extort money by threatening to accuse another of certain felonies, or of an infamous crime, is liable to penal servitude for life.

In Scotland, this offense is known as falsehood, fraud, and willful imposition. Each species of the offense which in England is punishable under the statute, in Scotland is indictable at common law. Thus, false personation, as where a man, in the assumed character of an exciseman, received money as a composition for smuggled goods, has been held to warrant a conviction of falsehood. So, also, where the deception consists in fictitious appearances; as where a man, by fitting his shop with false bales, induced another to trust him with goods. Obtaining money by begging-letters, and the common practice of chain-dropping, fall under this denomination of crime.

FALSE RETURN, Action for. Where a sheriff makes a false return to a writ, the party injured may maintain an action against him for damages. Thus, a return of *non est inventus* to a writ of *capias*, when the defendant might have been apprehended, or a return of *nulla bona* to a *fieri facias*, when there were goods which might have been seized, renders the sheriff liable in damages to the amount of loss occasioned by his negligence.

FALSE SIGNALS. By 7 Will. IV. and 1 Vict. c. 89, s. 5, the exhibiting any false light or signal, with intent to bring any ship or vessel into danger, is made felony, and punishable with death. The felonious intent may be proved by declarations made by the accused, or by circumstances which fairly lead to the conclusion of a guilty purpose. The punishment of death is recorded, but is not in fact carried out.

FALSE SWEARING. By 19 and 20 Vict. c. 79, s. 178 (bankruptcy, Scotland), any person guilty of falsehood in any oath made in the pursuance of the act, shall be liable to a prosecution at the instance of the lord advocate, or of the trustee in the sequestration, with consent of the lord advocate. But in the latter case, the prosecution must be authorized by a majority of the creditors present at a meeting called for the purpose. The person, on conviction, is liable, in addition to the punishment awarded, to forfeit, for behoof of the creditors, his whole claim under the sequestration. In England a bankrupt is not put upon oath; but on making a false declaration, he is deemed guilty of a misdemeanor and punishable with the penalty of perjury.

FALSET, or Falsetto, a term in singing for the highest register of a man's voice, which joins the natural or chest voice, and which, by practice, may be so blended with the chest-voice as to make no perceivable break.

FALSE VERDICT. The remedy in cases where it was alleged that a F. V. had been returned, was formerly by means of a writ of attaint. This writ originally lay only in cases where the jury had returned a verdict on their own knowledge of the facts, and proceeded on the assumption that, in returning a F. V., they were necessarily perjured. The case was heard before 24 men, and in case the original verdict was found bad, the jurors incurred the penalty of infamy and forfeiture of their goods. By statute of Westminster the first, c. 34, a writ of attaint was allowed upon an inquest; i.e., where cases had been decided upon evidence adduced. But the universal rule now established is, that though in most civil cases a new trial may be had for various causes, in no case can jurymen be punished, though finding a verdict against evidence. Writ of attaint was abolished by 6 Geo. IV. c. 50, s. 60.

FALSE WEIGHTS AND MEASURES. The use of false weights and scales is an offense at common law in England, and punishable by imprisonment. In Scotland, by 1607 c. 2, the users of false weights are punishable by confiscation of movables.

FALSIFY'ING RECORDS. The injuring or falsifying any of the documents of a court of justice is, by several modern statutes, made a serious offense. Any person obliterating, injuring, or destroying any record, writ, etc., or any original document belonging to any court of record or of equity, is guilty of felony, and is liable to be kept for 3 years in penal servitude, or be punished by 2 years' imprisonment, with or without hard labor, 24 and 25 Vict. c. 96, s. 30. By 24 and 25 Vict. c. 98, s. 28, any person employed to furnish certified copies willfully certifying any document as a true copy, knowing the same is not so, is guilty of a felony, and subject to 7 years' penal servitude. This act does not extend to Scotland. By 1 and 2 Vict. c. 94, any person employed in a public record office certifying any writing to be a true copy, knowing the same to be false in any material part, is guilty of felony, and may be punished with penal servitude for life.

FALSTER, a Danish island in the Baltic, s. of Seeland, lies between lat. 54° 30′ and 54° 58′ n., and between long. 11° 45′ and 12° 11′ e. It is separated by the strait called the Grönsund from the island of Moen, and by that called the Guldborgsund from the island of Laaland, together with which F. forms the stift or province of Laaland, a province which contains in all 635 sq.m., and which has about 200,000 inhabitants. F. is about 26 m. long, and 16 wide at its widest part, and has an area of about 178 sq. miles. It is flat, remarkably fruitful, and well cultivated, so that it resembles an attractive garden, and maintains in all about 23,000 inhabitants, who employ themselves chiefly in agriculture and cattle-breeding. The chief town is Nykjöbing, on the Guldbergsund. It is very old, has a castle and a cathedral, has some commerce and shipbuilding, and a pop. of (1870) 3,645. The only other place of any note is Stubbekjöbing.

FA'LUN, or FAHLUN (called also *Gamla Kopparberget*, i.e., the "old copper-mine"), is a t. of Sweden, capital of the län, or province, of the same name. It has long been famous for its copper-mines, though the quantity of ore now obtained is much smaller than formerly. In 1650, the yield was 3000 tons annually; this, however, declined, in 1690, to 1900 tons; while at present it is only about 400 tons. Gustavus Adolphus called the mines the "treasury of Sweden." The excavations extend for miles underground, containing vast chambers, where Bernadotte, the late king, gave splendid banquets, on which occasions the mines were brilliantly lighted up. F. is regularly built, and its houses are of wood, and blackened by the fumes of the numerous smelting-furnaces. Pop. '77, 6,741.

FALUNS, a term given by the agriculturists of Touraine to shelly sand and marl, which they use as manure, and applied by geologists to the deposits from which they are obtained. They are loosely aggregated beds of sand and marl, but occasionally so compacted by calcareous cement as to form a soft building-stone. The animal remains contained in them are chiefly marine, and of a more tropical fauna than that of the Mediterranean. A few land and fluviatile mollusca are found mixed with the oceanic forms, and with these are associated the remains of terrestrial quadrupeds, as dinotherium (q.v.), mastodon (q.v.), rhinoceros (q.v.), etc.

FA'MA (Gr. *pheme*) the goddess of rumor, appears in the works of the earliest poets. Sophocles makes her the child of Hope; Virgil, the youngest daughter of Terra, the sister of Enceladus and Cœus.

FA'MA CLAMO'SA, in the ecclesiastical law of Scotland, is a wide-spread report, imputing immoral conduct to a clergyman, probationer, or elder of the church. A F. C., if very clamant, may form the ground of process by a presbytery, without any specific complaint being brought before them, or there being any particular accuser. In these circumstances, the presbytery act for the vindication of their own order, and in behalf of the morals of the community. Should the inquiries of the presbytery lead them to the conviction that the rumor is not without foundation, they will serve the accused party with a libel, and thus bring him for trial before them. (Hill's *Church Prac.* 49; Cook's *Styles;* and Wood *On Libels.*)

FAMAGOS'TA, or FAMAGUSTA, is a seaport on the e. coast of Cyprus, on the supposed site of ancient Arsinoë, about 35 m. from Lefkosia (q.v.), the present capital of the island. It was a place of importance in the crusades, and under the Venetians from 1489 to 1571 it became a rich and flourishing city; with a population of fully 30,000 inhabitants, now only a few hundreds find shelter amongst the filthy ruins, the wreck of its churches and palaces. On coming under the sway of the Turks after a siege of four months, it fell into a state of decay; an earthquake in 1735 completed its ruin. The town is enclosed within well-built walls, constructed from the ruins of Salamis; but of its 300 churches, only one, that of St. Nicholas, remains. It is now used as a mosque, but contains many monuments of its former use, and is a fine specimen of medieval architecture; in it Richard I. of England crowned Guy de Lusignan king of Cyprus, in 1191. F. possesses a good natural harbor, about 8,000 ft. long, by 2,000 ft. wide, which would require to be cleansed before it could admit ships of the largest tonnage. The water in the bay exceeds 170 fathoms in depth. Under Turkish rule F. was

simply regarded as a military fortress and occupied by the sultan's troops; since Cyprus became a British possession, the affairs of the town and province have been administered by a resident civil commissioner and his assistant, with numerous native officials. About 5 m. n. are the ruins of ancient Salamis. Chief exports of F. are corn and pomegranates, for which the district is famous.

FAMAGOS'TA, or FAMAGUSTA (*ante*). See CYPRUS.

FAMILIARS. See INQUISITION.

FAMILIAR SPIRITS, a term employed to denote certain supernatural beings, in attendance upon magicians, wizards, witches, conjurors, and other skillful professors of the black art. The word "familiar" is in all likelihood derived from the Latin *famulus* (a "domestic," a "slave"). The belief in such spirits goes far back into the history of the race. We read of them in the time of Moses, who admonishes his countrymen to "regard not them that have familiar spirits" (Lev. xix. 31), which would imply the prevalence of the superstition among the Egyptians. The word in the original rendered "familiar spirits" is *oboth;* it is of frequent occurrence in the Hebrew Scriptures, and literally signifies "leathern bottles;" thereby indicating the antiquity of the idea that magicians were wont to imprison in bottles the spirits whom their spells had subdued (whence our "bottle-imps and "bottle-conjurors"); the origin, again, of which grotesque belief is perhaps to be sought for in the circumstance that mystical liquids kept in vials have been immensely in vogue among the conjurors of all ages and countries. It is not clear, as some think, that we can include Socrates among those who shared this vulgar superstition, for although he spoke of his attendant "dæmon" in very ambiguous terms, the opinion of all enlightened critics is, that he meant by the word nothing more and nothing less than what Christians mean by the presence of a divine light and guide in the heart and conscience. But according to Delrio—a great authority on this subject—the belief in familiar spirits in the grosser and more magical form did exist among the ancient Greeks, who, he affirms, designated such beings *paredrii*, "companions," as being ever assiduously at hand. The story of the ring of Gyges, king of Lydia, as narrated by Herodotus, is held by Heywood (see *Hierarchie of the Blessed Angels*, etc.) to prove the existence of the belief in that country also; and it is quite certain that during the middle ages the belief in "enchanted rings" containing familiar spirits was widely diffused throughout Europe, the magicians of Salamanca, Toledo, and those of Italy, being especially famous for their skill in thus subjugating and imprisoning demons. Asia, in fact, would seem to have been the original home of the belief in familiar spirits, which has long been established as a cardinal superstition of the Persians and Hindus, and which appears in perfection in the *Arabian Nights*. The "slave of the lamp" who waits upon Aladdin is an example in point. Whether the belief in familiar spirits sprung up independently among the nations of western Europe, or was transplanted thither by intercourse with the east, does not clearly appear. A favorite form assumed by the familiar spirit was that of a black dog. Jovius and others relate that the famous Cornelius Agrippa (q.v.), half philosopher, half quack, was always accompanied by "a devil in the shape of a black dog;" and add, that when he perceived the approach of death, he took a collar ornamented with nails, disposed in magical inscriptions, from the neck of this animal, and dismissed him with these memorable words: *Abi, perdita Bestia, quæ me totum perdidisti*—("Away, accursed beast, who hast ruined me wholly for ever"). Butler, in his *Hudibras*, speaks highly of this animal:

> Agrippa kept a Stygian pug
> I' the garb and habit of a dog
> That was his tutor, and the cur
> Read to the occult philosopher,
> And taught him subtly to maintain
> All other sciences are vain.

The readers of Goethe, too, will remember that Mephistopheles first appears to Faust and Wagner during their evening walk in this shape; but, in truth, the earliest instances of such transmigration are much older, at least if medieval tradition can be credited, for it assures us that Simon Magus and other ancient magicians had familiar spirits who attended them in the form of dogs. Curiously enough, in spite of the servitude to which the attendant imps were reduced by the potent spells of the magicians, they were popularly supposed, during the middle ages, to have their revenge at last, by carrying with them into eternal torment the souls of their deceased masters. This idea of divine retribution overtaking the practicers of magic is, however, not found *out* of Christendom. The Jews think not the less but the more of Solomon because he was, as they say, one of the greatest of magicians; and a similar feeling in regard to "wonder-workers" pervades eastern nations generally, though it is to be noticed that the latter are often represented as using their power malignantly. See MAGIC.

FAMILY (Lat. *familia*). Though we are in the habit of regarding the life of antiquity, and more particularly that of Greece, as less domestic than that of Christian Europe (and probably with reason), the idea of the family or house (Gr. *oikós*), as the nucleus of society, as the political unit, was there very early developed. Aristotle speaks of it as the foundation of the state, and quotes Hesiod to the effect that the original family consisted of the wife and the laboring ox, which held, as he says, to the

poor the position of the slave (*Polit.* i. 1). The complete Greek family then consisted of the man and his wife and his slave; the two latter, Aristotle says, never having been confounded in the same class by the Greeks, as by the barbarians (*Ib.*). In this form, the family was recognized as the model of the monarchy, the earliest, as well as the simplest, form of government. When, by the birth and growth of children, and the death of the father, the original family is broken up into several, the heads of which stand to each other in a co-ordinate rather than a strictly subordinate position, we have in these the prototypes of the more advanced forms of government. Each brother, by becoming the head of a separate family, becomes a member of an aristocracy, or the embodiment of a portion of the sovereign power, as it exists in the separate elements of which a constitutional or a democratic government is composed.

But at Rome the idea of the family was still more closely entwined with that of life in the state, and the natural power of the father was taken as the basis not only of the whole political, but of the whole social, organization of the people. In its more special aspects, the Roman idea of the family will be explained under PATRIA POTESTAS. Here it will be sufficient to state that with the Romans, as with the Greeks, it included the slave as well as the wife, and ultimately the children; a fact which indeed is indicated by the etymology of the word, which belongs to the same root as *famulus*, a slave. In its widest sense, the *familia* included even the inanimate possessions of the citizen, who, as the head of a house, was his own master (*sui juris*); and Gaius (ii. 102) uses it as synonymous with *patrimonium*. In general, however, it was confined to persons—the wife, children, grandchildren, and great-grandchildren, if such there were, and slaves of a full-blown Roman citizen. Sometimes, too, it signified all those who had sprung from a common stock, and would have been members of the family, and under the potestas of a common ancestor, had he been alive. See AGNATE. In this sense, of course, the slaves belonging to the different members of the family were not included in it. It was a family, in short, in the sense in which we speak of "the royal family," etc., with this difference, that it was possible for an individual to quit it, and to pass into another by adoption. See ADOPTION. Sometimes, again, the word was used with reference to slaves exclusively, and, analogically, to a sect of philosophers, or a body of gladiators. See Smith's *Dictionary of Greek and Roman Antiquities.*

The whole social fabric is based on the grouping of human beings in families; an arrangement which is in harmony with all the conditions and wants of human life, and which tends to foster those habits and affections that are essential to the welfare of mankind. A prosperous community must be an aggregate of happy families; there being little true happiness in the world that is not intimately connected with domestic life. The formal bond of the family is marriage (q.v.: see also POLYGAMY); and an essential condition of its right development seems to be a distinct abode, which shall be not a mere shelter, but a house or *home*, affording a certain measure of comfort and decency, according to the standard prevalent in the community. See *Genius and Design of the Domestic Constitution*, by Rev. Christopher Anderson (Edin. 1826).

FAMILY. See ORDER, *ante.*

FAMILY OF LOVE. See AGAPEMONE.

FAMINE, PORT, an abortive settlement of Spain, on the northern side of the strait of Magellan, is situated in lat. 53° 38′ s., and long. 70° 58′ west. It owes its name to the death, by starvation, of the Spanish garrison; and it is said to be now a penal colony of the republic of Chili. Some voyagers, however, have spoken of the neighborhood as "covered with flowers," and "decorated with luxuriance," and capable of being made, so far as soil is concerned, "one of the finest regions in the world."

FAMINES has been supposed to furnish a needful check upon an inordinate growth of population; and with that view, they have been deemed useful regulators of the universe. A table, recently prepared by Cornelius Walford, read before the statistical society of London in 1878 and 1879, and published under the title, *On the Famines of the World, Past and Present*, enumerates more than 350 famines which have occurred in history. It includes those mentioned in the Bible as afflicting Palestine and the neighboring nations in the time of Abraham (Gen. xii. 10), and of Isaac (Gen. xxvi. 1); the seven years' famine in Egypt; those in ancient Rome; those which have visited the three divisions of Great Britain; those of Europe in the middle ages; the 34 famines of India; and the terrible calamity which has lately ravaged northern China. The table does not claim to be exhaustive. Famines are known to have occurred in China, of which no details have been found; and similar instances have probably existed in Persia and elsewhere in Asia.

The paper teaches that famines have frequently resulted from want of human foresight, or the failure of human expedients. Analysis discloses the following causes of famine which might have been averted or ameliorated:

War.—It draws from their employments those who would be engaged in the cultivation of the soil; it withholds the labor necessary to gather the crops already produced; it often devastates the plains in order to starve out an enemy; it wastes and destroys at every step. At sea, it blockades ports, and diverts cargoes from their destinations; on land, it cuts off armies, cities, districts, from their supplies. Still further, war breeds pestilence; pestilence cuts off many who have escaped from the sword; the land lies

uncultivated; the live stock dies; and desolation follows. Hence the sword, pestilence, and famine are now, as they have been in all time, three associated deadly enemies of the human race.

Defective agriculture may result from ignorance, indifference, or unsuitability of climate, or location. Where the produce of the soil barely meets the current requirements of the inhabitants, it is clear that either the failure of a crop, or a sudden influx of strangers, may produce at least temporary famine. The distress in Ireland in 1879–80 was due in a large degree to the failure of the crops. Potatoes, still the staple food of a large proportion of the population, are set down in the agricultural returns of 1879 at 1,113,676 tons, against 2,526,504 tons in 1878; and of turnips there were but 2,057,804 tons, as compared with 4,686,226 tons of the previous year. The loss in money value to Ireland from this unfavorable harvest was estimated at over $50,000,000 as compared with 1878. This loss was distributed very evenly over the entire country, but its effect on the usually prosperous counties was only impoverishment, while it reduced to starvation those districts entirely dependent on this precarious article of food.

Deficient transportation was formerly a frequent cause of famines. Because of the bad state of the roads a famine has prevailed in one part of a country when there was a superabundance in another. The construction of canals, and subsequently of railroads, has greatly relieved this difficulty. In India the late famines might have been overcome if not averted, but for the want of the means of transport.

Legislative interference has been another cause of famines. It is not contended that in periods of emergency government should not step in and endeavor to mitigate the necessities of the hour; notable examples of such temporary restrictive regulations were shown by the more enlightened nations of antiquity; but it is a great mistake to attempt to regulate commerce to the subversion of the great principles of supply and demand. As an instance, we may cite the corn laws of Great Britain, which were repealed only at the indignant demand or the nation as recently as 1846. There is no doubt that the corn laws often prevented exportation of grain; but they permitted its importation only when prices reached or exceeded certain predetermined limits. The Irish famine of 1845–46 hastened their repeal.

Currency restrictions which tend to debase the value of current money, and thereby to lessen its purchasing power, especially in times of scarcity. The obvious manner in which a debased currency of paper or metal may operate in periods of scarcity is, that its purchasing power in all dealings with other nations is lessened not only in the degree to which it has been debased, but even to a greater extent by the prejudice, or the want of confidence, which its known debasement has inspired. Thus, if a merchant seeks to buy grain abroad, where the coinage value will have to be measured in relation to some coin of the country wherein the purchase is made, or in relation to the standard value of the precious metals in such country, it is certain that the coin tendered will have a purchasing power only in exact relation to its intrinsic character.

Speculating in grain and other food stuffs, known technically as forestalling, engrossing, regrating, etc., has undoubtedly tended to create famines, and in England offenses of this character were prohibited by statute in 1552, but these laws were in their nature arbitrary, and could be tolerated only because they appeared to be made in the interest of the people. Such laws are contrary to all known principles of political economy. Adam Smith and his followers succeeded in proving that no rational argument could be given for upholding them, and were largely instrumental in their final repeal.

Misapplication of grain. Under this head is mainly to be noted the excessive use of grain in brewing and distilling, and by burning, whether willfully or by misadventure; also those wanton acts of waste, such as burning grain-stores, firing ricks, which have too often occurred during periods of scarcity.

Among the natural causes of famines are:

Rain. By excess of rain the soil becomes saturated, and seed decays. In hilly countries the seed is sometimes washed entirely out of the ground, and so is destroyed. This cause of famine is most frequent in tropical countries, where the rains often become torrents. Improved cultivation of the land, with good drainage, is the most effective remedy. Inundations from the sea, from rivers, from inland lakes, fall within this category, and have caused great mischief.

Frost. In temperate regions frost in several forms is destructive to vegetation. In the case of grain cultivation it may, by setting in early, prevent the efficient manipulation of the soil, and the sowing of the autumn seed. Or by being protracted beyond the early months of the year, it will prevent spring sowing, and even seriously injure the young crops. Combined with rain it will frequently destroy the vitality of the seed while yet in the ground. In France and other wine and olive producing countries, the damage occasioned by frost is immense. Such damage, as well as that occasioned by floods, is there a recognized danger against which insurance is purchased.

Drought. In all climates of a tropical character, drought is an important agent in preventing the development of vegetation. With moisture, solar heat develops luxuriant growth; without the moisture there is absolute sterility. The early Bible records refer to the rising of the waters of the Nile as the event upon which the fertility of Egypt depends. About 1060, the overflowing of this great river failed for seven successive years, occasioning one of the greatest famines of history. Two provinces were wholly

depopulated, and in another, half the inhabitants perished. Even in temperate climates long-continued drought is very disastrous.

Earthquakes seem to have but little influence in producing famine, except in the immediate locality of their devastations. Where, however, they have produced irruptions of the sea or inland waters, which has not infrequently been the case, the damage has been extensive.

Hurricanes and storms frequently produce wide-spread injury. They also lead to irruptions of the sea, and to the overflowing of rivers; but as a rule these occur at periods of the year when grain and other crops are not sufficiently advanced to sustain serious damage by shaking or otherwise, or else when they have been harvested.

Hail-storms are usually local in their effects—rarely extending beyond 60 m. in their greatest length, and some 6 m. in width, and generally confined to much smaller limits. They are most prevalent and destructive to grain and fruit in the summer and autumn months. In France hail-storms are frequent and severe. The damage which they occasion has long been insured against in all parts of Europe.

Insects, vermin, etc. Insect plagues appear to have afflicted mankind from a very early period. Thus, flies and locusts were among the plagues of Egypt. The potato-growing regions of the United States and Canada have been seriously afflicted in the last twenty years by the various species of insects known as potato-bugs. The recent famine in North China began in one district by a visitation of locusts. In India such visitations have occurred several times. England has suffered by plagues of insects, especially in 476, and again in 872. But few instances are recorded in which rats, mice, etc., destroyed crops to any serious extent. In 1581, there was a plague in Essex, England, and in 1812–13, a plague of rats in the Madras presidency, which in part occasioned the famine of that year.

Famines Celebrated in History.

B.C.

1708. Egypt; the famine of seven years began.
436. Rome; thousands threw themselves into the Tiber.

A.D.

42. Egypt; awful famine.
262. Rome; attended by plague.
272. Britain; people ate the bark of trees.
306. Scotland; thousands died.
310. England; 40,000 perished.
370. Phrygia; awful famine.
450. Italy; parents ate their children.
739. England, Wales, and Scotland.
823. again; thousands starved.
954. again; lasted four years.
1016. Awful famine in all Europe.
1087. England, 21st year of William I.
1193. England and France; produced pestilential fever, until 1195.
1251. England.
1315. England; people ate horses, dogs, cats, and vermin.
1335. England; caused by long rain.
1353. England and France.
1438. England; bread was made from fern roots.
1565. Great Britain.
1693. France; awful famine.
1748. Great Britain; general throughout the realm.
1771. Bengal; devastated the country.
1775. Cape de Verde; 16,000 persons perished.
1789. France; grievously felt.
1795. England; severely felt.
1801. England; throughout the kingdom.
1813. Drontheim; when Sweden intercepted supplies.
1814, 1816, 1822, 1831, 1846. Ireland. The poor suffered greatly because of failure of the potato. In 1847, parliament voted $50,000,000 to relieve the suffering of the people.
1837–8. North-western India; above 800,000 perished.
1860–1. North-western India; thousands perished.
1865–6. Bengal and Orissa; about 1,000,000 perished.
1868–9. Rajpootana, etc.; about 1,500,000 perished.
1871–2. Persia; very severe.
1874. Bengal; caused by drought.
1874–5. Asia Minor.
1877. Bombay, Madras, Mysore, etc.; about 500,000 perished.
1877–8. Northern China; very severe.

[Compiled from *Encyclopædia Britannica*, 9th ed.]

FAN, an instrument or mechanical contrivance for moving the air for the sake of coolness, or for winnowing chaff from grain. In the east, the use of fans is of remote antiquity. The Hebrews, Egyptians, Chinese, and the miscellaneous population of India, all used fans as far back as history reaches. At the present day, it is customary, in the better classes of houses in India, to suspend a large species of F. from the ceiling, and keep it in agitation with strings, pulled by servants, in order to give a degree of coolness to the air. See PUNKAH. Among the oldest notices of winnowing fans are those in the Scriptures. There the F. is always spoken of as an instrument for driving away chaff, or for cleansing in a metaphorical sense; and such notices remind us of the simple processes of husbandry employed by a people little advanced in the arts. It was a long stride from the use of a simple hand-instrument for winnowing to that of the modern mechanism employed for a similar purpose. See FANNERS; BLOWING MACHINES.

As is observable from the collection of Egyptian antiquities in the British museum, the F. as an article of female taste and luxury is of quite as old date as the instrument is for commoner purposes. Terence, a writer of Latin comedies, who lived in the 2d c. B.C., makes one of his characters speak of the F. as used by ladies in ancient Rome: *Cape hoc flabellum, et ventulum huic facito*—"Take this fan, and give her thus a little air." From this Roman origin, the fashion of carrying fans could scarcely fail to be handed down to the ladies of Italy, Spain, and France, whence it was in advanced times imported by the fair of Great Britain. Queen Elizabeth, when in full dress, carried a fan. Shakespeare speaks of fans as connected with a lady's "bravery" or finery:

> With scarfs and fans, and double charge of bravery.

It is proper to say, however, that the F. was in these and also in later times not a mere article of finery. There were walking as well as dress fans. The walking or outdoor F. which a lady carried with her to church, or to public promenades, was of large dimensions, sufficient to screen the face from the sun, and answered the purpose of the modern parasol (q.v.). In old prints, ladies are seen carrying these fans in different attitudes according to fancy. The dress F., which formed part of a lady's equipment at court ceremonies, drums, routs, and theatrical entertainments, was of a size considerably less than the walking F., and altogether more elegant. Of these dress fans there exist numerous specimens bequeathed as heirlooms from one generation to another; indeed, there are few ladies who cannot show several of different eras throughout the 18th c.; some being in good preservation, while in others the gilded stars and cupids which delighted the eyes of great-grandmothers have a mournfully tarnished appearance. In the finer kinds of these old fans, the open part of paper is painted with pretty rural scenes and groups of figures in the style of Watteau (q.v.). All were probably of French manufacture. The more costly F. imported from China was, and still is, altogether of ivory, highly carved and pierced; but it wants the lightness and flexibility which were essential in the ordinary management of this article of the toilet. Strictly speaking, the F. was used less for the purpose of cooling than for giving the hands something to do, and also for symbolically expressing certain passing feelings. In the hand of an adept, the F., by peculiar movements, could be made to express love, disdain, modesty, hope, anger, and other emotions. Gay, speaking of Flavia's accomplishments, says:

> In other hands, the fan would prove
> An engine of small force in love.

Considering the coarseness of language, even in the higher circles, in the early part of the 18th c., we cannot wonder that the F. should have been indispensable to a lady going into company. It was held up to shield the countenance when anything too shocking for female ears was uttered. Pope has an allusion to this use of the fan:

> The modest fan was lifted up no more,
> And virgins smiled at what they blushed before.

Steele, in a paper in the *Tatler*, No. 52, Aug. 9, 1709, gives an amusing account of Delamira, a fine lady, resigning her F. when she was about to be married. One of her female acquaintances, having envied the manner in which this charming and fortunate coquette had played her F., asks her for it. Delamira acknowledges the wonderful virtues of the F., and tells her that "all she had above the rest of her sex and contemporary beauties was wholly owing to a F. (that was left her by her mother, and had been long in the family), which, whoever had in possession, and used with skill, should command the hearts of all her beholders; 'and since,' said she smiling, 'I have no more to do with extending my conquests or triumphs, I will make you a present of this inestimable rarity.'" Two years later, Addison, in a paper in the *Spectator* (No. 102), gives a humorous account of the tactics of coquettes in the use of fans: "Women are armed with fans as men with swords, and sometimes do more execution with them;" then he goes on to describe how ladies are instructed to handle, discharge, ground, and flutter their fans—the whole being a pleasant satire on the fan-maneuvering in the reign of queen Anne.

Later in the 18th c., fans served another important purpose. At dancing assemblies in London, Bath, and elsewhere, it was usual for the gentlemen to select their partners

by drawing a fan. All the ladies' fans being placed promiscuously in a hat, each gentleman drew one, and the lady to whom it belonged was his allotted partner. Mrs. Montagu, in one of her letters, refers to this custom: "In the afternoon, I went to lord Oxford's ball at Mary-le-bone. It was very agreeable. The parties were chosen by their fans, but with a little *supercherie*." Of the trick or fraud which this authoress delicately veils under a French term, the beaus of that period were far from guiltless. A lady's F. was almost as well known as her face, and it was not difficult, with a little connivance, to know which to draw. At Edinburgh, where it appears to have been the practice to select a partner for a whole season, the fans of the ladies were carefully studied. Sir Alexander Boswell alludes to this species of stratagem in one of his poems:

> Each lady's fan a chosen Damon bore,
> With care selected many a day before;
> For unprovided with a favorite beau,
> The nymph, chagrined, the ball must needs forego.

In Italy, Spain, the West Indies, and also some parts of the United States, fans are largely in use for giving the sensation of coolness during hot weather, and for this purpose they may sometimes be seen in the hands of gentlemen as well as ladies. In Spain, the old fashion of fan-flirting appears to be still in vogue. A late traveler in that country says: "I was vastly interested in the movements of the ladies' fans at church. All the world knows that Spanish fans are in perpetual motion, and betray each feeling, real or assumed, that passes through the mind of the bearer. I felt convinced I could guess the nature of the service at every particular moment by the way in which the fans were waving. The difference between a litany and a thanksgiving was unmistakable; and I believed that minuter shades of devotion were also discoverable."— *Vacation Tourists* (1861).

With other changes in manners, fans are no longer used in English fashionable circles for the frivolous purposes noticed in their past history; they still continue, however, to form an article of ceremonial dress at dinner and other evening parties. In embellishing them, foreign as well as native art is exerted on a scale commensurate with their price. From the superior kinds, composed of ivory and silk, costing 20 guineas, down to those of wood and paper, which are sold at 6*d.* or 1*s.*, there are varieties to suit every toilet and pocket. Lately, fans made tastefully of feathers, also fans constructed of straw and variously colored ribbons, have been among the novelties of fashion. In the case of a general court mourning, ladies are enjoined to use "black paper fans." The manufacture of fans of various kinds is carried on in England, France, Belgium, Spain, and other European countries, likewise in the United States; and now, as formerly, the F. is an article of export from China to many parts of the world. W. C.

FANAR'IOTS, the general name given to the Greeks inhabiting the Fanar or Fanal in Constantinople, a quarter of the city which takes its name from the beacon (Gr. *phanarion*) situated in it. They first appear in history after the taking of Constantinople by the Turks, and appear to have been originally descendants of such noble Byzantine families as escaped the fury of the barbarians. Afterwards, however, the class was recruited by emigrants from different parts of the old Byzantine empire. Subtle, insinuating, intriguing, they soon took advantage of the ignorance of the Turkish governors, and made themselves politically indispensable to their rulers. They filled the offices of dragomans, secretaries, bankers, etc. One of them, named Panayotaki, at a later period, was appointed dragoman to the divan, and his successors obtained still greater honors. Through their influence, the lucrative office of dragoman of the fleet was called into existence, which gave them almost unlimited power in the islands of the Archipelago. Besides, from them were chosen, until the outbreak of the revolution in 1822, the hospodars of Wallachia and Moldavia, while, in addition, the disposal of most of the civil and military posts under the Turkish government was in their hands. In spite of their power, however, the F. never exhibited much patriotism; they were animated by the petty motives of a caste, and when the war of liberation broke out among their countrymen, they took no part in it. In the present altered state of affairs in Turkey, they have no political influence. See Marco Zalloni's *Essai sur les Fanariots* (Marseilles, 1824; 2d ed. 1830). Consult also Finlay's *History of the Greek Revolution* (Edin., Blackwood & Sons, 1861).

FANCY. See IMAGINATION.

FANDAN'GO, like the *bolero*, is an old Spanish national dance, in three-quarter time. It is danced most gracefully in the country, usually to the accompaniment of a guitar, while the dancers beat time with castanets, a custom borrowed from the Moors. It proceeds gradually from a slow and uniform to the liveliest motion; and notwithstanding the simplicity of the *pas*, vividly expresses all the graduations of the passion of love, in a manner sometimes bordering on licentiousness. The people are so passionately fond of it, that the efforts of the clergy have never been able to suppress it.

FANEUIL, PETER, 1700–43; b. N. Y., of French-Huguenot descent; became a merchant in Boston. He was the builder of Faneuil hall, the pride of old Boston, given to that city by him as a personal donation.

FANEUIL HALL, a spacious public hall in Boston, Mass., erected in 1742 by Peter Faneuil, and presented by him to the town. In its original condition as so gifted, the building contained a hall for public meetings, with lesser apartments above, and a basement used as a market. In 1761, it was destroyed by fire, and rebuilt. During the revolutionary struggle with England, the hall was so often used for important political meetings, that it became known as "the cradle of American liberty." In 1805, the building was increased in height by an additional story, and also increased in width. It is now an edifice about 80 ft. square; the hall contains some fine paintings; and the basement is no longer used as a market.

FANFARE is the French name of a short and lively military air or call, executed on brass instruments. It was brought by the Arabs into Spain, whence it passed into Mexico and the new world. *Fanfaron*, derived from F., is the name given to a swaggering bully or cowardly boaster, probably because of the empty noise he makes when "blowing his own trumpet," or threatening timid people, and the term applied to his idle braggadocia and vaporing vaunts is *fanfaronnade*.

FANG (A.-S. a catching or grasp, from *fon*, to seize; pp. *fangen;* comp. Ger. *fangen*, to catch). In the terminology of the law of Scotland, a thief taken *with the fang* is one apprehended while carrying the stolen goods on his person. It is not very long since this word formed part of the common speech of Scotland:

> "Snap went the shears, then in a wink,
> The *fang* was stowed behind a bink."
> *Morison's Poems*, p. 110.

In England, also, the verb *fang* was still in use in Shakespeare's time: "Destruction *fang* mankind!" (*Timon of Athens*, iv. 3); and "Master Fang," in *Henry IV.*, is named after his office. We still use the phrase "in the fangs," for in the clutches; and the fangs of a dog or of a serpent are its teeth with which it catches or holds.

FANNERS, a machine employed to winnow grain. In passing through the machine, the grain is rapidly agitated in a sieve, and falling through a strong current of wind, created by a rotatory fan, the chaff is blown out at one end, and the cleansed particles fall out at an orifice beneath. The apparatus is composed chiefly of wood, and though ordinarily moved by the hand, it is sometimes connected with the driving power of a thrashing-mill. The F. superseded the old and slow process of winnowing, which consisted in throwing up the grain by means of sieves or shovels, while a current of wind, blowing across the thrashing-floor, carried away the chaff. "A machine for the winnowing of corn was, as far as can be ascertained, for the first time made in this island by Andrew Rodger, a farmer on the estate of Cavers in Roxburghshire, in the year 1737. It was after retiring from his farm to indulge a bent for mechanics, that he entered on this remarkable invention, and began circulating what were called *fanners* throughout the country, which his descendants continued to do for many years."—*Domestic Annals of Scotland*, by R. Chambers, vol. iii. Strangely enough, there was a strong opposition to the use of this useful instrument; the objectors being certain rigid sectaries in Scotland, who saw in it an impious evasion of the division will. To create an artificial wind, was a distinct flying in the face of the text, "He that formeth the mountains, and createth the wind."—Amos iv. 13. Apart from the folly of the objectors, who carried their fancies to the extent of petty persecution, we are amazed at their apparent neglect of the fact, that the winnowing of corn by artificial means, in which fans performed a conspicuous part, is mentioned repeatedly in the Old Testament. See FAN. The advantages in using the F. soon overcame all prejudices on the subject, and the objections to the use of the machine are now remembered only by tradition, and by a passage in one of the imperishable fictions of Scott. In the tale of *Old Mortality*, Mause Headrigg is made anachronously to speak to her mistress about "a newfangled machine for *dighting* the corn frae the chaff, thus impiously thwarting the will o' Divine Providence, by raising wind for your leddyship's use by human art, instead of soliciting it by prayer, or patiently waiting for whatever dispensation of wind Providence was pleased to send upon the shieling-hill."

FANNIÈRE, FRANÇOIS AUGUSTE, and FRANÇOIS JOSEPH, b. the first in 1818, and the other in 1822; French engravers of especial eminence. Their masterpieces are two shields representing incidents from *Orlando Furioso*. Auguste is a member of the legion of honor.

FANNIN, a co. in n. Georgia, on the Tennessee and North Carolina borders; 425 sq.m.; pop. '70, 5,429—114 colored. It has a mountainous surface, and much of it is yet uncultivated. Co. seat Morgantown.

FANNIN, a co. in n.e. Texas on Red river, crossed by the Texas and Pacific railroad; 800 sq.m.; pop. '70, 13,207—2,484 colored. The surface is undulating, the soil fertile, and timber abundant. Co. seat, Bonham.

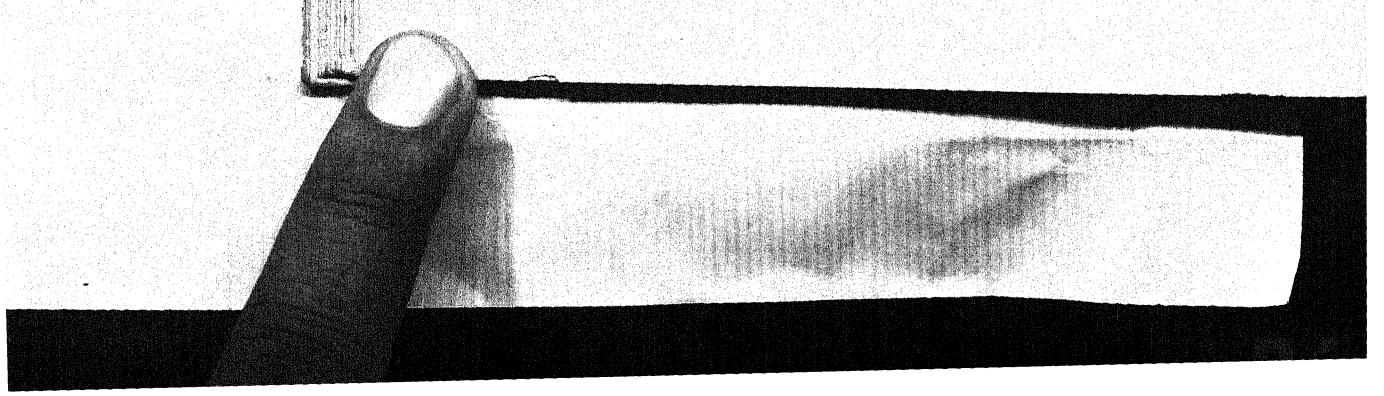
FANNIN, JAMES W., b. N. C., killed at Goliad, Texas, 1836. Being defeated by a superior force of Mexicans, Fannin and 356 others surrendered as prisoners of war, with the stipulation that they should be treated according to the ordinary rules. Instead of

carrying out the agreement Santa Anna ordered them to be shot, Fannin being the last victim.

FANNING, DAVID, 1756–1825; b. N. C. Having been robbed at the beginning of the revolution, by men who claimed to be whigs, Fanning became a tory, and committed many daring outrages, killing several men who had incurred his enmity. In one case he rushed into a village where a court was in session, and carried off the judge, lawyers, and spectators. Not long afterwards he captured Gov. Burke and his entire suite. When the patriots gained rule he fled to Florida, and from there to St. John, N. B. Here he was a member of the colonial assembly; but his character was developed in many villainies, culminating finally in sentence to death for rape; but he escaped from prison, and was afterwards pardoned.

FANNING, EDMUND, LL.D., 1737–1818; b. Long Island; a graduate of Yale. He was a tory in the revolution, and raised and commanded a regiment in the king's service. After the war he was rewarded with the offices of councilor and lieutenant-governor of Nova Scotia, and governor of Prince Edward's island. He rose to maj.gen. in the British army.

FA'NO (Lat. *Fanum Fortunæ*, so called from the temple of Fortune, which the Romans erected here in commemoration of the defeat of Asdrubal on the Metaurus) is the name of a town and seaport of Italy, in the province of Urbino e Pesaro, finely situated in a beautiful and fertile district, on the shore of the Adriatic, 30 m. n.w. of Ancona, and near the mouth of the Metaurus. It is well built, is surrounded with walls and ditches, has a cathedral dedicated to St. Fortunato, and numerous churches, containing many valuable paintings, among which are several of the best works of Domenichino, and an excellent "Annunciation" by Guido. The remains of a triumphal arch of white marble, raised in honor of Augustus, form perhaps the chief object of classical interest at Fano. Pop. 6,500, who carry on considerable trade in corn and oil, and in silk goods. Here, in 1514, pope Julius II. established the first printing-press with Arabic letters known in Europe. The port of F. was once well known to the traders of the Adriatic; its commerce, however, has declined, and the harbor become, to some extent, choked up with sand.



FAN PALM, a name common to all those palms which have fan-shaped leaves, as the species of *mauritia*, *lodoicea* (double cocoa-nut), *hyphæne* (Doum palm), *corypha*, *livistona*, *chamærops*, etc. The only truly European palm, *chamærops humilis* (q.v.), is a F. P., as is also the North American palmetto. The talipot palm (*corypha umbraculifera*) is sometimes called the great fan palm. The Palmyra palm is another fan palm. The fan-shaped leaf is produced by an abbreviation of the midrib of a pinnated leaf.

FANS, THE, a race of aborigines in equatorial Africa, residing on the tributaries of the Gaboon river, and said to be cannibals; the accounts of this savage race are, however, still imperfect, and what is mentioned respecting them wants confirmation.

FANSHAWE, Sir RICHARD, was b. in 1608, at Ware Park, in the co. of Hertford; studied at Jesus college, Cambridge; and in 1626, became a member of the inner temple. On the outbreak of the civil war, he took part with the king; and in 1648, became treasurer to the navy under prince Rupert. He was taken prisoner at the battle of Worcester; and on his release, withdrew to Breda in Holland, where Charles II. was holding his court in exile. After the restoration, he was appointed ambassador at the court of Madrid, where he died, in 1666. F. was an author of considerable reputation. His most celebrated work, now very rare, is a translation of Guarini's *Pastor Fido*, the lyrical passages of which are rendered with remarkable skill and elegance. The volume in which it appeared was published in 1664, and contains other pieces in prose and verse.

FANTA'SIA, in music, the name of a composition of a similar character to the capriccio; also given to extempore effusions performed by a musician who possesses the rare gift of producing, as it were, off-hand music like a well-studied, regular composition. Hummel was more celebrated for his extempore fantasias on the pianoforte than even for his published compositions. Frederick Schneider was equally great for his free fantasias on the organ,

FANTEE, a section of the gold coast of Africa, lying along the gulf of Guinea, now under British protection. The country is well watered, fertile, and populous; the inhabitants belonging to the same family as the Ashantees, but more muscular, remarkably cleanly, and distinguished from other African tribes by small scarifications on the cheeks and back of the neck. They are separated from the Ashantees by a belt of almost untraversed forests, and declaring their independence, controlled about 100 m. of the coast. During a war with the Ashantees in 1807, they secured the aid of the English, but nevertheless were overrun by their enemies. They rebelled, with English help, in 1823, but were again subdued, and the British commander, sir Charles McCarthy, was captured and killed; but in 1823, the Ashantees were driven out of the Fantee territory, and until 1872 the Fantees were unmolested. In that year, the Ashantees complained of the treaty transferring the Dutch coast colonies to the English, and in 1873, the Ashantee king overran the Fantee country, and even threatened Cape Coast castle with a native force of 50,000. He was driven back, however, by sir Garnet Wolseley, in 1874.

FANTOCCI'NI. See PUPPET.

FAN-TRACERY VAULTING, a kind of late Gothic vaulting (15th c.), so called from its resemblance to a fan. The ribs or veins spring from one point, the cap of the shaft, and radiate with the same curvature, and at equal intervals, round the surface of a curved cone or polygon, till they reach 'the semicircular or polygonal ribs which divide the roof horizontally at the ridge level. The spaces between the ribs are filled with foils and cusps, resembling the tracery of a Gothic window; hence the name *fan-tracery.* The spaces between the outlines of the fans at the ridge level, are called by prof. Whewell (*German Churches*) ridge lozenges. In Henry VII.'s chapel, Westminster, one of the best examples of this kind of vaulting, these lozenges are occupied by pendants, which produce a most astonishing effect, looking like arches resting on nothing. They are, however, supported with great ingenuity by internal arches, rising high above the visible vaulting. This is one of the *tours-de-force* which astonish the vulgar, but are only adopted when art has reached a low level, and has in a great measure given place to artifice. Fan-tracery is a very beautiful kind of vaulting, and is peculiar to England, where it originated, and where alone it was practiced. Among the finest examples are Henry VII.'s chapel at Westminster; St. George's, Windsor; and king's college chapel, Cambridge. Fan-tracery is also frequently used in the vaulting of cloisters, as at Canterbury, Chester, etc.

FARAD, in electricity, a unit of quantity. See *Units of the Current Elements* in art, GALVANISM.

FARADAY, MICHAEL, D.C.L., d. 1867, one of the most distinguished chemists and natural philosophers of the present century; a splendid instance of success obtained by patience, perseverance, and genius, over obstacles of birth, education, and fortune. He was born in 1791, near London, his father being a blacksmith. He was early apprenticed to a bookbinder; yet even then he devoted his leisure time to science, and amongst other things, made experiments with an electrical machine of his own construction. Chance having procured him admission, in 1812, to the chemical lectures of sir H. Davy (q.v.), then in the zenith of his fame, he ventured to send to Davy the notes he had taken, with a modest expression of his desire to be employed in some intellectual pursuit. Davy seems to have at first endeavored to discourage him, but finding him thoroughly in earnest, soon engaged him as his assistant at the royal institution. He traveled with Davy to the continent, as assistant and amanuensis. On their return to London, Davy confided to him the performance of certain experiments, which led in his hands to the condensation of gases into liquids by pressure. Here he first showed some of that extraordinary power and fertility which have rendered his name familiar to every one even slightly acquainted with physics, and which led to his appointment, in 1827, to sir H. Davy's post of professor of chemistry in the royal institution. We shall give a brief summary of his more important discoveries and published works, arranging the different subjects according to their position in various branches of science, rather than in their chronological order.

In chemistry, we have his treatise on *Chemical Manipulation,* 1827; 2d ed. 1842, even now a very valuable book of reference. His *Lectures on the Non-metallic Elements,* and *Lectures on the Chemical History of a Candle,* delivered at the royal institution in 1860, were published shortly after. As discoveries or investigations of a high order in this branch of science, we may mention—new compounds of chlorine and carbon, 1821; alloys of steel, 1822; compounds of hydrogen and carbon, 1825; action of sulphuric acid on naphthaline, 1826; decomposition of hydrocarbons by expansion, 1827; and the very valuable series of experiments made in 1829–30, on the manufacture of glass for optical purposes, which resulted in one of his greatest discoveries.

As practical applications of science, his preparation of the lungs for diving, and ventilation of light-house lamps, are conspicuous, as are also his celebrated letter on table-turning, and his lecture on mental education.

To enumerate only the most prominent of his publications on physical science, we may commence with the Condensation of the Gases (already referred to); then we have Limits of Vaporization, Optical Deceptions, Acoustical Figures, Regelation, Relation of Gold and other Metals to Light, and Conservation of Force. Of these, the condensation of gases into liquids and solids, though previously effected by others (and F. has ever been the foremost to acknowledge another's priority), he has really made his own, not only by the extent and accuracy of his experiments, but by the exquisite experimental methods by which he effected the results. His ideas on regelation, and its connection with the motion of glaciers, have not met with universal acceptance, though (see HEAT, ICE, GLACIER) there is no dispute as to his being correct in his *facts.* In regard to conservation of force, there can be no doubt that he has been led into a fallacy, by mistaking the technical use of the word *force* (see FORCE), for in his article on the subject he describes experiments made with the view of proving the conservation of *statical,* not *dynamical* force, whereas the doctrine of conservation asserts merely the conservation of "energy," which is *not* statical force. He *may* be right also, but if so, it will be by a new discovery, having no connection whatever with "conservation of energy."

His Christmas lectures at the royal institution, though professedly addressed to the

young, contain in reality much that may well be pondered by the old. His manner, his unvarying success in illustration, and his felicitous choice of expression, though the subjects were often of the most abstruse nature, were such as to charm and attract all classes of hearers. Besides two sets (already mentioned) on chemical subjects, we have his *Lectures on the Physical Forces*, a simple work, but in reality most profound, even in its slightest remarks.

But the great work of his life is the series of *Experimental Researches on Electricity*, published in the *Philosophical Transactions* during the last forty years and more. Fully to understand all the discoveries contained in that extraordinary set of papers, would require a knowledge of all that has been discovered during that time as to electricity, magnetism, electro-magnetism, and diamagnetism. We may merely mention the following, almost all of which are discoveries of the *first* order. They are given in the order of publication, which is nearly that of discovery: 1. Induced Electricity, 1831, comprehending and explaining a vast variety of phenomena, some of which have already been applied in practice (especially as magneto-electricity) to light-houses, electro-plating, firing of mines, telegraphy, and medical purposes. Electric currents derived from the earth's magnetism. 2. The Electro-tonic State of Matter, 1831; 3. Identity of Electricity from Different Sources, 1833; 4. Equivalents in Electro-chemical Decomposition, 1834; 5. Electro-static Induction—Specific Inductive Capacity, 1838; 6. Relation of Electric and Magnetic Forces, 1838; 7. The Electricity of the Gymnotus, 1839; 8. Hydro-electricity, 1843; 9. Magnetic Rotatory Polarization, 1846; 10. Diamagnetism and the Magnetic Condition of *all* Matter, 1846; 11. Polarity of Diamagnetics, and the Relation of Diamagnetism to Crystalline Forces, 1849; 12. Relation of Gravity to Electricity, 1851. This, as before remarked, is F.'s attempt to prove a conservation of *statical* force. 13. Atmospheric Magnetism, 1851. An attempt to explain the diurnal changes of the earth's magnetic force by the solar effect on the oxygen of the air; a very interesting paper.

F., who had received a pension in 1835, was in 1858 appointed a house in Hampton court. In 1862, he gave his last discourse on "gas-furnaces;" and advocated the use of magneto-electric light in light-houses. In 1865, he resigned the position of adviser to the Trinity house, also that of director of the laboratory of the royal institution. See *Life of Faraday*, by Tyndall (1869); and by Bence Jones (2 vols. 1870).

FARADIZATION. See ELECTRICITY, MEDICAL, *ante*.

FARALLO'NE ISLANDS, a group of small islands off the coast of California, the nearest one 32 m. w. of the entrance to San Francisco bay. They lie parallel with the coast, and their extreme points are about 12 m. apart. On the s. Farallone is an important light-house. These islands are the resort of myriads of sea-fowl, gulls, and murres, whence eggs are carried, in great quantities, to the San Francisco market by a company which owns the islands.

FARCE, a dramatic piece of a low comic character. The difference between it and comedy proper is one of degree, and not of kind. The aim of both is to excite mirth; but while the former does so by a comparatively faithful adherence to nature and truth, the latter assumes to itself a much greater license, and does not scruple to make use of any extravagance or improbability that may serve its purpose. It does not, therefore, exhibit, in general, a refined wit or humor, but contents itself with grotesque rencontres, and dialogues provocative of fun and jollity. The name is differently explained. In any case, it comes originally from the Latin *farcire*, to stuff; but while Adelung says that, in the middle ages, *farce* signified in Germany certain songs, which were sung between the prayers during divine service, others derive it from the Italian *farsa*, this from the Latin *farsum* (stuffed); while Paolo Bernardi states that it comes from a Provençal word *farsum*, meaning a *ragout*, or mess of different ingredients, an opinion which has this to say for itself, that the *dramatis personæ*, *Jack-pudding*, etc., were generally named after special dishes or mixtures. The first farces are said to have been composed by the society of the *Clercs de Bazoche* in Paris, about the year 1400, as a contrast to the ecclesiastical plays performed by the religious orders. The most widely celebrated and the oldest is the *Farce de Maître Pierre Pathelin*, which some consider to be a composition of the 13th c., but which was more probably executed by one Peter Blanchet, about 1480. Subsequently, Molière elevated and refined the farce into pure comedy, in his *Médecin Malgré lui*, *Malade Imaginaire*, *Les Fourberies de Scapin*, and other inimitable productions. In England, the origin of the modern F. dates from about the commencement of the 18th century. It then began to be regarded as something distinct from comedy proper, and to constitute a special theatrical entertainment. Of all the numerous farces which have been performed before English audiences, only those of Samuel Foote have kept a place in literature.

FARCY in horses depends upon the same causes as glanders (q.v.), which it usually precedes and accompanies. The absorbent glands and vessels, usually of one or both hind-limbs, are inflamed, tender, swollen, hard, and knotted. The vitiated lymph thus poured out softens, and ulcers or F. buds appear. Unlike the ulcers of glanders, they are curable, but require time and care. They must be scarified with the hot iron, which, to prevent their spreading, may also be gently run over the adjacent sound skin. Good

feeding and comfortable lodgings are essential, and if they do not interfere with the appetite, give tonics, such as a dram each of sulphate of copper and iodine, repeated twice a day.

FARDEL-BOUND, a disease of cattle and sheep, consists of impaction of the fardel bag, or third stomach, with food, which is taken in between the leaves of this globular stomach, there to be fully softened and reduced. When the food is unusually tough, dry, or indigestible, consisting, for example, of overripe clover, vetches, or rye-grass, the stomach cannot moisten and reduce it with sufficient rapidity; fresh quantities continue to be taken up, until the overgorged organ becomes paralyzed, its secretions dried up, and its leaves affected with chronic inflammation. The slighter cases so common amongst stall-fed cattle are "loss of cud," indigestion, and torpidity of the bowels. In severer form there is also fever, grunting, swelling up of the first stomach, and sometimes stupor or epilepsy. The overgorged stomach can, moreover, be felt by pressing the closed fist upwards and backwards underneath the false ribs on the right side. The symptoms often extend over ten days or a fortnight. Purgatives and stimulants are to be given. For a full-grown beast, give, in 3 or 4 bottles of water or thin gruel, ½ lb. each of common and Epsom salt, 15 ground croton beans, a dram of calomel, and 2 oz. of ginger. If no effect is produced, repeat this in 12 or 15 hours. Inject soap-and-water clysters every hour, withhold all solid food, and allow only sloppy mashes, treacle and water, or thin linseed tea. An occasional bottle of ale, with an ounce or two of ginger, often expedites the action of the physic, and wards off nausea and stupor.

FAREHAM, a market-t. and sea-bathing place in the s. of Hampshire, on a creek at the n.w. end of Portsmouth harbor, 12 m. e.s.e. of Southampton, and 9 m. n.n.w. of Portsmouth. It has manufactures of earthenware. Pop. '71, 7,023.

FAREL, GUILLAUME, one of the most active promoters of the reformation in Switzerland, was b. in the year 1489 in Dauphiné. He studied at Paris, and was at first distinguished by his extravagant zeal for the practices of the Catholic church. "Truly," says he in one of his letters, "the papacy itself was not so papistical as my heart." Intercourse with the Waldenses, and with his friend Lefevre d'Etaples, induced him to study the Scriptures; the result was his conversion to Protestantism, and F., who was by nature vehement even to indiscretion, immediately commenced to proselytize. The chief scene of his labors was France and Switzerland. At Basel, 15th Feb., 1524, he opened his career of controversy and evangelization by publicly sustaining 30 theses on the points in dispute between Roman Catholicism and Protestantism. In less than two months, he was compelled to leave, mainly on account of a quarrel between himself and Erasmus, whom, on account of his moderate or trimming policy, F. had compared to Balaam. F. next went to Strasburg, and afterwards to Montbeliard, where his iconoclastic way of preaching the gospel excited the alarm of his friends, several of whom, Œcolampadius among others, censured him sharply for his violence. His zeal was next manifested in the canton of Bern. It was also chiefly through his exertions that the towns of Aigle, Bex, Olon, Morat, and Neuchâtel followed the example of Bern in embracing the reformation. In 1532, he went to Geneva, where his success was at first so great, that on account of the agitation excited, he had to leave the city. He returned in 1533, was again compelled to withdraw, but once more entered it in 1534. This was his year of triumph; the reformers filled the churches, and the Catholic clergy, who had made themselves odious to the citizens by abetting the despotic schemes of the duke of Savoy, retired to Lausanne and Fribourg. In Aug., 1535, the town council of Geneva formally proclaimed the reformation. F., however, was a missionary, not a legislator, and the organization of the Genevan church passed into the hands of Calvin (q.v.). The severity of the new ecclesiastical discipline produced a reaction, and in April, 1538, the two reformers were expelled from the city. F. took up his residence at Neuchâtel, where the reformed church was in a state of deplorable disorder. He composed its differences, and drew up a constitution, which it accepted, after long and stormy debates, in 1542. In Sept. of the same year, we find him fighting the battle of the reformation at Metz. After his return to Neuchâtel, he frequently visited Calvin, whose authority in Geneva had been completely restored. It was on one of these occasions that he was present at the burning of Servetus, and though not, comparatively speaking, a bigoted Calvinist, he allowed his orthodoxy on that occasion to choke his humanity, exclaiming, as the unhappy heretic uttered his last prayer to God from the flames: "See what power the devil has over one who has fallen into his hands." In 1557, along with Beza, he was sent to the Protestant princes of Germany, to implore their aid for the Waldenses, and on his return—inexhaustible in his activity—he sought a new sphere of evangelistic labor in the regions of the Jura mountains. When trembling upon threescore-and-ten, he married a young wife, very much to Calvin's disgust, who sarcastically speaks of him under the circumstances as "our poor brother." But neither his newly formed domestic ties, nor the infirmities of age, could quench his missionary zeal. In 1560–61, he proceeded to his native Dauphiné, and passed several months at Gap, preaching against Catholicism with all the ardor of his youth. In Nov., 1561, he was thrown into prison, but was shortly after rescued by his friends. In 1564, he paid a visit to the dying Calvin; his strength, however, was now nearly exhausted, and on the 13th Sept., 1565, he expired at Neuchâtel, leaving a son

named Jean, who survived him only three years. F. was a man of extensive scholarship, and wrote largely, but his works very inadequately represent the genius of the man. Compare Kirchhofer's *Das Leben Wilhelm Farels* (2 vols., Zurich, 1831–33), and C. Schmidt's *Etudes sur Farel* (Strasburg, 1834); also his *Wilhelm F. und Peter Viret* (1860).

FAREWELL, CAPE, the southern extremity of Greenland, lies in lat. 59° 49′ n., and long. 43° 54′ west. It is generally beset with ice, which, according to recent authorities, appears to come from the n.e., and to sweep round into Davis' strait. Hence it is but little known; and, in fact, the Danish traders, in passing to and from the settlements on West Greenland, seem uniformly to maintain an offing of more than 100 miles.

FARI'A Y SOUSA, MANOEL, a Portuguese historian and poet, was b. of an ancient family at Caravella, in the province of Entre Minho e Douro, 18th Mar., 1590, and studied at the university of Braga. For some time he was in the service of the bishop of Oporto, but shortly after 1613 he went to Madrid, where, however, he did not long remain, as he found no opportunity there of improving his circumstances. In 1631, he obtained the office of secretary to the Spanish embassy at Rome, where his extensive acquirements procured him the notice of pope Urban VIII. and of all the learned men of the city. After some time, he returned to Spain, and died at Madrid 3d June, 1649. Faria's writings are partly in Spanish, and partly in Portuguese. Of the former, we may mention *Discursos morales y politicos* (2 vols., Madr. 1623–26), *Epitome de las Historias Portuguesas* (Madr. 1628), *Comentarios sobre la Lusiada* (2 vols., Madr. 1639), *Asia Portuguesa* (3 vols., Lisbon, 1666–75), *Europa Portuguesa* (3 vols., Lisbon, 1678–80), *Africa Portuguesa* (Lisbon, 1681), and the greater portion of his poems, which he collected under the title of *Fuente de Aganippe o Rimas Varias* (Madr. 1644–46). These poems consist of sonnets, eclogues, canzones, and madrigals. Faria, however, composed about 200 sonnets and 12 eclogues in the Portuguese language; and it is mainly by these, and also by three theoretical treatises on poetry, that he has influenced the development of the poetic literature of Portugal, in which he was long regarded as an oracle. His poetry exhibits talent and spirit, but is on the whole tasteless and bombastic. Faria is not to be confounded with another Portuguese author of the same name, who was born at Lisbon in 1581, and died at Evora in 1655, and who was one of the most learned numismatists of his age.

FARIBAULT, a co. in s. Minnesota on the Iowa border, traversed by Mankato river, and the Southern Minnesota railroad; 720 sq.m.; pop. 75, 11,131. Surface undulating, and soil fertile, producing wheat, corn, butter, etc. Co. seat, Blue Earth City.

FARIBAULT, the seat of justice of Rice co., Minn., on Cannon river, and the Chicago, Milwaukee, and St. Paul railroad, 53 m. s. of St. Paul; pop. '75, 5,525. It has a fine court-house, a Roman Catholic academy, and convent, the Seabury divinity school, the Shattuck school, and a number of manufactories.

FARIDPUR, or FURREEDPORE, a district of British India in the Dacca division of Bengal, bounded n. and e. by the Ganges, w. by the Chandná and Madhumati, and s. by the Bákaganj; 1506 sq.m.; pop. '72, 1,012,589, of whom 588,299 were Mohammedans, and 420,988 Hindus. The district is flat in the s., but higher in the n., and a great portion is subject to inundation. The villages are built on artificially raised sites, or the higher banks of the streams. The climate is damp, the average annual rain-fall being 85½ in., and the mean temperature 77°. The chief rivers are the Ganges, the Arial Khar, and the Madhumati, which are navigable. Rice is the great crop; others are wheat, barley, oats, corn, oil-seeds, beans, sugar-cane, betel-leaf, date-palms, and indigo. More than half the cultivated surface is sown with rice. Three railroads intersect the district.

FARI'NA is the term used by many writers on bees, instead of *pollen*, to denote the pollen of flowers collected by bees for feeding their larvæ. See BEE.

FARI'NA, a Latin term for meal or flour, which has been adopted into the English and other languages, and is very frequently employed both in scientific and popular works. The term F. is also frequently extended to many substances which agree with the meal of the corn-plants or cerealia (q.v.) in containing much starch, and food made of such substances is often called *farinaceous*, its qualities more or less resembling those of the food derived from the cerealia. Of the different kinds of F., those produced by mere trituration of the seeds of grasses (corn), hold the first place for importance and usefulness. Most similar to them are those obtained in the same manner from certain other seeds. See CEREALIA. The F. of the different kinds of pulse (q.v.), or seeds of leguminous plants, has considerably different properties. For the qualities, chemistry, commercial importance, etc., of the different kinds of meal, see MEAL. Other farinaceous substances, consisting chiefly of starch, are obtained from roots—often from tubers—of plants of very different natural orders; some kinds also, as sago, from stems. Cassava meal, which contains, along with starch, much vegetable fiber and protein or albuminous substances, is commonly called F. (*farinha*) in many parts of South America, where it is a principal article of food.

Fossil farina, mountain milk, or *agaric mineral,* is a deposit of silicified animalcules,

obtained from China, etc. In 100 parts, it consists of silica 50½, alumina 26½, magnesia 9, water and organic matter 13, with traces of lime and oxide of iron.

FARINELLI (real name CARLO BROSCHI), 1705–82; b. Naples; a remarkable soprano singer, whose voice was of unequaled compass, possessing seven or eight notes more than those of ordinary vocalists. His career was one of unbroken triumph. In Spain his voice was used by the queen to cure Philip V. of his melancholy mania, and he acquired such influence over the king as to be in power, if not in name, the real prime minister. Night after night he sang to Philip the same six songs, never varying the programme. Through his influence the Italian opera was established in Madrid.

FARI'NI, CARLO LUIGI, an Italian author and statesman, was b. in 1822, at Russi, in Ravenna, in the n. of Italy. Having, with great success, studied medicine at Bologna, F. first became known by several publications belonging to the science of medicine, and soon afterwards by contributions to various scientific periodicals. In 1841 and 1842, having mixed himself up with politics, he was obliged to leave the Roman states, and change his residence repeatedly, until he finally settled at Turin. The amnesty following shortly upon the accession of Pio Nono, opened to F. not only his native country, but also a new career, through the liberal system inaugurated by the supreme pontiff. In 1847, he was called into the reformed ministry, as a substitute to the home secretary; in 1848, he was present in the suite of Carlo Alberto at Volta, and after the flight of the king, protested against the proclaiming of a republic. During the short ministry of the unfortunate Rossi (q.v.), F. was director-gen. of the sanitary and prison department at Rome, from which post, however, he retired as soon as the reaction under Antonelli began to be established. Upon the occupation of Rome by the French, F. became once more an exile, but for a short time only, for in Piedmont he found a home as well as public honors. In 1850, he held the seat of minister of public instruction in the cabinet of Victor Emmanuel II., and on retiring from office, was named a member of the supreme council. When Central Italy resolved to annex itself to the kingdom of Victor Emmanuel, by means of universal suffrage, it was F. who directed the popular mind with such admirable success that, on the day of ballot, not one vote was delivered asking for a separate kingdom. As governor of Central Italy, he showed an undaunted courage against the threats of Austria, and exhibited a thoroughly consistent moderation against the unruly promptings of the Mazzinians. The same qualities accompanied his measures when the newly acquired kingdom of Naples was to be reorganized. In 1861, F. became minister of commerce and public works. In 1862, he took office as president of the cabinet, which he resigned in 1863. He died in 1866. It has been said that "Farini was the mind of Italy, as Garibaldi was its sword." Among his literary productions may be mentioned, *Il Stato Romano* (The Roman State), translated into English under the superintendence of the right Hon. W. E. Gladstone (London, 4 vols., 1859); *Storia d'Italia* (History of Italy), a continuation of Botta's celebrated work. F. was also a contributor to count Cavour's *Risorgimento.*

FARIS ECCHIDIAK, an Arab poet and *littérateur,* was b. about the year 1796. In religion, he is a Syrian Christian. He studied at Cairo, under the ulamas of the mosque of El-Azhar, and in 1836 procured for M. Fresnel some very valuable commentaries upon the poem of *Shanfara.* He was afterwards invited to Malta by an English missionary society, who wanted his services in their oriental printing establishment. The dedication of a poem to the bey of Tunis about 1847, induced that monarch to send a war-vessel to Malta, for the purpose of bringing F. to Tunis, where the poet obtained a distinguished reception, and many rich presents. Subsequently, he went to England, where he was employed in revising the text of a translation of the Bible into Arabic, by the society for the propagation of the Scriptures. In 1851, he published in London the New Testament in Arabic. He subsequently resided in France for a considerable time, and published there, along with M. G. Dugat, in 1854, a French grammar in his native tongue for the use of the Kabyles of Algeria. His principal work is entitled *La Vie et les Aventures de Fariak* (Paris, 1855); it contains a narrative of his own travels, with critical observations on the Arabs and other peoples whom he visited. Some of his own poems are also interspersed. F. returned to London the year before the publication of this work. On the outbreak of the Crimean war, the sultan appointed him one of his dragomans or interpreters, but he has never discharged the duties of his office. F. is said to possess in manuscript a collection of poems, called *The Divan,* which are highly spoken of by those who have seen them.

FARLEY, MICHAEL, 1719–89; b. Mass.; a revolutionary leader; member of the general court; delegate to the provincial congress; member of the executive council, and delegate to the convention for framing the U. S. constitution.

FARM (of uncertain derivation), the term usually employed in Britain to signify a piece of land, either in pasture or in cultivation, held in lease by a tenant from the proprietor. In the United States, the term farmer is often applied to a person who owns as well as cultivates land. The tenure on which land is held by farmers varies in different countries. In some parts of continental Europe, the farmer hires the land on the principle of a kind of partnership with the proprietor. See METAYER. In England,

much of the land is let for a certain annual rent, and mostly either by a yearly term, or at the good-will of the landlord. Leases of different durations have latterly been introduced. In Scotland, the process of land-letting is on a footing which has been advantageous for tenant and proprietor, and has served the best interests of agriculture. The greatly altered and improved system of husbandry of the last half-score years or so, demands something more for successful agriculture than the provisions of the ordinary lease contain. Under the Scotch 19-years lease, the farmer is encouraged to starve the land towards the close of the period of contract, in order to recoup himself as far as possible for his outlays in the shape of manure, by the expiry of the lease, should he have to quit the holding then. The practical result of this is that the land is in a fully productive state about half the duration of the lease. The vastly increased expenditure connected with farming, and the growing and already great necessity for the most being made of the limited land resources of this country, call for more security to the tenant's capital than the lease provides. A strong desire has therefore lately sprung up in Scotland and England for compensation to outgoing tenants for permanent improvements, and even unexhausted manures. This is as much a tenant's as a landlord's question, as it will require more capital to enter a farm than is presently needed. The landlord presumably provides the houses for the farms, but the higher farming of recent years having rendered the former supply of buildings insufficient, considerable difficulty is experienced in obtaining proper house accommodation on many farms, on estates where the landlord's capital happens to be locked up by the keys of entail.

The method of paying rent for farms in Scotland is not uniform. In some districts the annual rent is a fixed sum; but in others, such as the Lothians and best wheat-growing districts, it is a common practice to pay partly a fixed sum, and to leave another portion to be paid in grain, or rather the money value of so much grain according to the average market prices each year, as determined by a jury in every county. See Fiars. This last plan is not so popular as it once was, and most farmers now prefer to pay a fixed sum. In whatever manner the rent is adjusted, it is stipulated to be paid, as nearly as possible, in two equal portions, at Whitsunday (May 15) and Martinmas (Nov. 11), but in practice many of the landlords give three months' credit on each occasion—the Whitsunday rent being exigible at Lammas (Aug. 4), and the Martinmas rent at Candlemas (Feb. 2). At all times, however, the landlord has a right of hypothec (q.v.) over the crops, and can take measures to avoid being defrauded of his proper claims. Usually good feeling subsists between landlord and tenant.

The landlord commonly binds his tenant to farm or cultivate the land according to the most approved systems in use in the district. Such a course may be necessary in some cases to prevent the abuses that might arise from negligence or ignorance; but the restrictions have often been carried too far, and have formed barriers in the way of improvements. So far as regards mere cropping, it would not be much amiss, however, on most arable farms, to forbid more than one half of the land being in white crops during the last four years of the lease. Green crops prevent the land being overrun with weeds. It is perhaps not superfluous to observe here that leases should be written in clear and concise language, and as far removed from ambiguity as possible. There is much need of more simplicity and brevity in the agricultural lease.

The size of farms is regulated by many circumstances. On land adapted for green cropping, and remote from towns, large farms form good subjects for capitalists, and consequently prevail. Stiff clay soils are rather against extensive culture. Where crops are grown that require much hand-labor, farms become small in size. Flax, rape, vines, and market-garden produce all tend to lessen the size of farms. In new countries, too, where there is no slave labor, farms are mostly small. To the discomfiture of many a family, the custom was in Scotland, some twenty years ago, to enlarge the arable farms by grouping two or three into one. Bad on principle, however, this system has had its day, and the tendency of affairs is now if anything in the opposite direction. Grazing farms, whether in the Highlands or Australia, form good outlets for large capitalists.

Under the modern system of farming in Britain, from £12 to £18 of capital per acre is required to farm arable land; and if a heavy live-stock is kept, more capital is required. The rent of Highland grazing varies from 1*s.* 6*d.* to 6*s.* a head for each sheep kept; the value of each sheep being from £1 to £3, according to the kind and age of the stock.

The profits of farming fluctuate quite as much as those of any other trade. Strict personal superintendence is one of the first requisites of success. Without this, the details will be neglected, and loss will ensue. Ten per cent on the capital invested is a good return, but very few have so much. For several years back many farmers have lost money, while few have exceeded 3 per cent profit on the capital invested. Better times, however, appear in store for the farmer. Skill and attention are the qualities which command success in farming as in other things.

A farmer necessarily possesses large numbers of animals—horses, cattle, sheep, pigs, and poultry. These have all to be reared and tended, and demand no little care and

experience. Proper seeds must be selected; and the proper cultivation of the land for the different crops necessitates a succession of processes which require to be attended to. These, however, will be taken up under their respective heads.

FARM BUILDINGS. Each farm must possess a residence for the farmer, cottages for the servants, and buildings for the stock and crop. The *farm-house* should be commodious and plain, and of considerable extent. The cottages for the servants should also be plain and roomy, and internal convenience should be more studied than outward ornament. A strong feeling is arising on this subject in Scotland, and a bill is now before parliament with the view of providing better cottage accommodation.

Proper offices are essential to the economical disposing of the produce of the farm. The corn crops are usually thrashed there, and a large portion of the green crops is consumed by stock, which must be well provided with shelter from the cold. When few turnips were raised, and few cattle fed, large open courts were best suited for converting the straw into manure. Now, however, in many cases, the excrements of the stock are sufficient for wetting all the straw, and hence has arisen the practice of feeding in covered courts and in boxes. In this case, the solid and liquid excrements are carted out along with the straw, which acts the part of a sponge. This is no doubt an excellent way of manufacturing home-made manure; it takes a considerable quantity of straw, however; and as more green crops are raised and consumed on the farm, sufficient straw cannot always be got to absorb all the liquid; hence, a saving of the straw is effected by stall-feeding, when the excess of liquid must be collected into tanks, and otherwise disposed of. When it is remembered that ammonia cannot be purchased in the market at the present time under £80 per ton, and that liquid manure contains a high percentage of ammonia, the utility of husbanding this material must be very evident. Liquid manures should be absorbed by moss or soil, or be carted out, and distributed by pipes, when the plants are in a growing state, otherwise part will be washed out of the soil. Covered farm-yards are rapidly extending over the country. It is the cheapest and best way of erecting farm-offices. On some estates, new steadings have been erected on a too extravagant plan for the size and requirements of the farm. This is simply a burden on the holding. Landlords should not stick so rigidly to a uniform plan of steading, irrespective of the extent and necessities of the different occupancies. In a design for a "farm steading," commended by the judges of the Berwick cattle-show in 1854, the steading is on the covered principle, all the various departments being under one roof. The food-preparing houses are ranged as convenient as possible to those in which the food is to be consumed, and the relative positions of every other department have been carefully studied. This is to be attended to in the formation of all homesteads.

Ventilation.—Without good ventilation, a covered homestead must be a nuisance. All the apartments are so arranged that, unless fresh air circulate through them, and they are kept perfectly clean, there must constantly be unwholesome effluvia in the interior—the foulness of one apartment being communicated to another. The system of ventilating this farmstead is certain to give most satisfactory results, if only ordinary care be taken to keep the different houses as clean as they ought to be. The arrangements are briefly as follows:

Under each feeding-passage is built a circular air-shaft, 30 in. in diameter; in connection with these there are feeding-mouths with gratings on the outside of the building; inside, there are numerous finely perforated gratings; by sliding-valves, wrought by a cord and pulley, the supply of air is regulated. Besides these, there are gratings every 10 or 12 ft. along the exterior walls, perforated so as to admit near the floor a considerable quantity of air. The roof, too, is provided with ventilators with vertical spars, and openings are left here and there in the sarking, to act as induction and eduction tubes. The numerous perforated apertures throughout the building will admit twice the quantity of air required for the respiration of the animals, and are so under command that they will neither admit flies in summer, nor too large a supply of cold air in winter. A covered steading, somewhat similar in construction to the above, has been erected at Glen, in Peeblesshire, where the ventilation of the inclosed cattle-courts, etc., is admirable, and within the last few years considerable numbers of courts have been covered with decided advantages.

To carry out this principle of ventilation is somewhat expensive. A cheap and yet efficient system of ventilation for cattle is to cover the yards with pan-tiles without plaster or lath. Those who wish to see farm-offices economically erected, at the same time combined with the most perfect ventilation, we would recommend to visit some on the property of lord Kinnaird, Rossie Priory, Perthshire. For further information, see *The Book of Farm Buildings*, by Henry Stephens, F.R.S.E., and R. Scott Burn (Edin., Blackwood & Sons, 3d ed., 1871).

FARMER, Hugh, 1714–87; an English theologian, a pupil of Dr. Doddridge. Among his works are *An Inquiry into the Nature and Design of our Lord's Temptation in the Wilderness; Dissertation on Miracles, designed to show that they are Arguments of a Divine Interposition, and Absolute Proofs of the Mission and Doctrine of a Prophet;* and *The General Prevalence of the Worship of Human Spirits in the Ancient Heathen Nations Asserted and Proved.*

FARMER, JOHN, 1789–1838; b. Mass.; especially devoted to genealogy. In 1829 he published a *Genealogical Register* which it was thought contained the names of nearly all the first European settlers in New England. A new edition with many additions was issued in 1862. He edited Belknap's *History of New Hampshire*, to which he added many valuable notes.

FARMER, RICHARD, D.D., a well-known scholar of the last century, was b. at Leicester, Aug. 28, 1735, and was entered a pensioner of Emmanuel college, Cambridge, in 1753. In 1760, he took his degree of M.A., and was appointed classical tutor of his own college. It is not known when he took orders, but, while he held the office of tutor, he acted as curate at Swavesey, a village 8 m. from Cambridge. In 1766, he published his once famous *Essay on the Learning of Shakespeare* (reprinted in 1789 and in 1821), the purpose of which was to show the sources whence the great dramatist derived his knowledge of the ancients. F. proved that it was from translations, and that Shakespeare has often cited the phraseology, and even the errors, of the translators. In 1775, he was elected to the mastership of Emmanuel college, and in 1778, chief-librarian of the university. In 1780, he obtained a prebendal stall at Lichfield, but in 1788, resigned it for the office of canon residentiary of St. Paul's. He died Sept. 8, 1797.

FARMERS-GENERAL (Fr. *fermiers-généraux*) was the name given before the revolution of 1789 to the members of a privileged association in France, who farmed or leased the public revenues of the nation. This peculiar system of tax-gathering dates from an ancient period. For each class of imposts there was a special administrative board, presided over by one of the farmers-general, or by one of his assistants. At first, the leasing of the public revenues was based on the competitive system, and determined by the estimates handed it; but latterly, every formality, every preliminary guarantee of this nature disappeared, and the leasing wholly depended on the favor or jobbery of the government officials. The minister of finance selected the farmers-general at his pleasure, but his choice was always regulated by the present, or rather bribe (*pot-de-vin*) offered to him; and which, we may presume, was never inconsiderable, inasmuch as its value was fixed by the minister himself. Generally, shares in the concern were assigned by the king to his favorites, male and female. The number of farmers-general was ordinarily 40, but shortly before the revolution it had risen to 60. The lease was signed by a salaried deputy, who was responsible to the king alone. The king occupied the position of a creditor towards the farmers-general, and could coerce them into payment of the stipulated sum as a just debt; the farmers-general, on the other hand, occupied a similar position towards their subordinates. The entire sum which it was necessary to place in the national treasury—or, in other words, the annual national revenues—amounted to 180 millions of livres. The rest was enormous profit, for we are certainly within the mark in estimating it at seven million of livres. The powers, rights, and duties of the farmers-general were defined by special decree; but however severe may have been the fiscal laws against fraud and contraband, it is notorious that, shortly before the revolution, abuses of the most flagrant description had demoralized the system and the men. The consequence was inevitable. During the revolution, most of these odious tax-gatherers perished on the scaffold, the innocent among them being occasionally confounded with the guilty—the real capitalist with the selfish and greedy adventurer. Even the virtues and the learning of the illustrious Lavoisier could not save him.

Farmers of the revenue are an institution of ancient origin. The Roman *publicani* (q.v.) were officers of this kind; and duties of various kinds were at one time farmed in Great Britain. See EXCISE.

FARMING'S ISLAND, an island reported to be in the north Pacific ocean, n. of the Sandwich islands, in lat. 30° 49′ n., and long. 159° 20′ w., was formally taken possession of, for the queen of England, on the 8th Feb., 1861, by her majesty's steamer *Albert*. The harbor was called English Harbor, and a point, on which there is a settlement, was termed English Point.

FARMINGTON, a village in a town and on a river of the same name in Hartford co., Conn., 31 m. n. of New Haven, on the New Haven and Northampton railroad; pop. of town, 2,616. It is an ancient, quiet, and beautiful village; with little business, but fine literary advantages. There are several churches, schools, and a seminary of the highest grade for girls. In the town there are some manufactories.

FARMINGTON, the seat of justice of Franklin co., Maine, on Sandy river, 75 m. n. of Bath, at the n. terminus of the Androscoggin division of the Maine Central railroad; pop. 3,251. It contains the court-house, the Western Maine normal school, Abbott family school, the Wendell institute for girls, and several manufactories. There are slate quarries in the vicinity.

FARM-SERVANTS. The introduction of large farms caused a wide difference to arise between the condition of master and servant. The latter has no doubt had his condition meliorated, though something remains yet to be done. Large farms effect economy in the amount of labor, and where these superseded the small holdings or pendicles, a certain number of the population had to betake themselves to the towns or the colonies. This latter process had the effect of diminishing the population in the country districts. The general advance, however, which has taken place in the

wages of the laboring-classes has been happily shared in by farm-servants for some years, and they are now well paid if they were only better housed. Farmers complain of the comparatively inferior class of servants they get nowadays, even for the increased wage. In the strictly agricultural county of Dorsetshire, wages range from 14*s.* to 20*s.* a week. In the manufacturing districts, such as in Yorkshire, they are generally somewhat higher, ranging from 17*s.* to 20*s.* a week. In Scotland, plowmen are generally paid partly in produce, but taking everything into account, wages amount to from 18*s.* to 24*s.* a week all the year through for good hands. In the n. of England, the best farm-servants are now receiving from 20*s.* to 24*s.* per week. For housing, see BOTHY. Female farm-servants receive from £12 to £18 a year, with food. Some get £12 even for the summer half-year.

FARNE, FEARNE, or FERN **ISLES**, or the STAPLES, form a group of 17 islets and rocks, some being visible only at low tide, 2 to 5 m. off the n.e. coast of Northumberland, opposite Bamborough. On one of the isles is the tower of a priory, built to the memory of St. Cuthbert, who spent the last two years of his life here. There is a hole called the churn, through which the sea rises. The passage between the isles is very dangerous in rough weather. Two of the islands have each a light-house. Here the *Forfarshire* was wrecked in 1838 (see DARLING, GRACE); and here, in 1843, the *Pegasus* met the same fate, and 60 persons were drowned.

FARNE'SÉ, the name of an illustrious family in Italy, whose origin can be traced to the middle of the 13th c., when it possessed the castle of Farneto, near Orvieto. Many of its members have filled the highest offices in the church. In 1534, cardinal ALESSANDRO FARNESE was raised to the papal see under the title of pope Paul III. (q.v.), and as his great aim was the aggrandizement of his family, he erected Parma and Piacenza into a duchy, which he bestowed on his natural son, PIETRO LUIGI. Pietro was one of the most dissolute men of his period, and after many tyrannical attempts to limit the privileges of the nobles, he was assassinated 10th Sept., 1547. He was succeeded by his son OTTAVIO (born 1520, died 1585), who married a natural daughter of Charles V., and whose reign was marked by an unbroken peace, and by various efforts made for the good of his subjects.

ALESSANDRO FARNESE, son of Ottavio, was born in 1546. He served his first campaign under his uncle, Don John of Austria, and distinguished himself at the battle of Lepanto, in the year 1571. He afterwards followed his mother into the Low Countries, then in a state of insurrection, and aided in obtaining the victory at Gembloux, 31st Jan., 1578. He was made governor of the Spanish Netherlands by Philip II., and carried on the war against the prince of Orange. The ill success of the expedition against England, to the command of which he had been appointed by Philip II., grieved him the more from the contrast it presented to his former successes. On his return to the Netherlands, he was appointed commander-in-chief of the army dispatched to the assistance of the Catholics in France, and compelled Henry IV. to raise the siege of Paris. Being, however, ill supplied with provisions and money by Philip, and insufficiently supported by the league, he was forced to yield to the superior power of Henry IV., and died soon after at Arras, in 1592. F. was really an able warrior, and though severe in his discipline, was almost worshiped by his soldiery. RANUCCIO, his son and successor, did not possess the brilliant qualities of his father: he was somber, austere, greedy, and proud. A conspiracy was hatched against him, and Ranuccio was seized, and thrown into prison. He died in 1622.—ODOARDO, a natural son of the preceding, was a prince remarkable for the elegance of his manners, and also, according to Muratori, for his magnificence, magnanimity, and liberality. He died in 1646, at the age of 34.—The family became extinct in the person of ANTONIO F., who died in 1731.

The name of the Farnese family has been bestowed upon several celebrated works of art. These are—1. The *Farnese Palace* at Rome, an edifice raised by pope Paul III., before his accession to the holy see, after the design of Antonio da San Gallo. It is in the form of a quadrangle, and was completed by Michael Angelo. The palace is one of the finest in Rome. The antique sculptures for which it was formerly renowned are now in the museum at Naples; a few classic works, however, are still to be seen in the great hall. The gallery contains the frescoes of Annibal Caracci, which are very valuable, as exhibiting in the most complete manner the new line of art which he struck out. In a room adjoining the gallery, are some mythological fresco-paintings by Domenichino. 2. The *Farnesina* is a very elegant palace in Trastevere. It owes its celebrity chiefly to the frescoes of Raphael; but it also contains frescoes by Peruzzi, Sebastian del Piombo, and a colossal head in *chiar-oscuro*, attributed to Michael Angelo. Among the antiques, formerly belonging to the Farnese family, now in the museum at Naples, are two which still bear the name of their original owners. 3. The *Farnese Bull* is the name given to a colossal group attributed to Apollonius and Tauriscus of Tralles, in Asia Minor, who probably belonged to the Rhodian school, and lived about 300 B.C. The group represents Dirce bound to the horns of a bull by Zethus and Amphion, for ill usage of her mother—a subject which, notwithstanding the vigorous mode of treatment, is on the whole unsatisfactory. Pliny mentions the transference of the group to Rome, where it first adorned the library of Asinius Pollio, and afterwards the baths of Caracalla. It was discovered anew in the year 1546, restored by Bianchi, and placed in the Farnese

palace. 4. The *Farnese Hercules*, copied by Glykon from an original by Lysippus. It exhibits the hero, exhausted by toil, leaning upon his club; the muscles and veins are still swollen, the head inclined, the expression melancholy; one hand rests upon his back and grasps one of the apples of the Hesperides.

FARNHAM, a t. in the w. of Surrey, on the left bank of the Wey, 10 m. w.s.w. of Guildford. It consists chiefly of one street running e. and west. The principal feature is the stately old castle of the bishops of Winchester, first built by bishop de Blois, brother of king Stephen. The castle was razed by Henry III., rebuilt and garrisoned by Charles I., and restored in 1684 to its present state by bishop Morley. It is an embattled quadrangle of brick, covered with stucco. A new town-hall was erected in 1866. F. has belonged to the bishops of Winchester since 860, when Ethelbald of Wessex bestowed it on them. Some parts of the parish church were built in the 12th, 15th, and 16th centuries. The chief trade is in hops, a very fine variety of which is grown in the vicinity. Pop. '71, 4,461. William Cobbett was born and is buried here. The vicinity of Aldershott camp, which is only about 6 m. to the n. of F., has increased the activity of the town

FARNHAM, ELIZA WOODSON (maiden name BURHANS), 1815–64; b. N. Y.; married in Illinois to Thomas J. Farnham, the traveler. In 1841, she returned to New York, visited prisons, and lectured to the women convicts until 1844. She was four years matron of the Sing Sing state prison. In this period she published *Life in Prairie Land*, and edited Samson's *Criminal Jurisprudence*. In 1848, she was connected with the Boston institution for the blind. She was in California from 1849 to 1856, then returned to New York, and published *California, Indoors and Out*. *My Early Days* appeared in 1859, and in that year she organized a society to aid and protect destitute women in emigration to the west. *Woman and Her Era* was published in 1864.

FARNHAM, RALPH, 1756–1861; b. Me.; a soldier in the revolution, and the last survivor of the battle of Bunker hill. He was the first settler in Acton, Me. He lived 104 yrs. 5 ms. and 19 days. About a year before his death he was complimented by a grand concert in Tremont temple, Boston.

FARNHAM, THOMAS JEFFERSON, 1804–48; b. Vt. In 1839, he led a small expedition across the continent to Oregon. In California, the same year, he procured the release of a large number of American and English prisoners from the Mexican government. His *Travels in Oregon Territory* appeared in 1842; *Travels in California* and *Scenes on the Pacific*, in 1845; a *Memoir of the North-west Boundary Line*, and *Mexico, its Geography, People, and Institutions*, in 1848.

FARN'WORTH, a t. of Lancashire, 2½ m. s.e. from Bolton-le-Moors, near the Tonge, a branch of the Irwell. It is a station on the Manchester and Bolton railway. It has a picturesque embattled chapel, of the 15th century. The manufacture of sail-canvas, watches, files, etc., is carried on. Pop. '71, 13,550.

FA'RO, a pleasant and wealthy episcopal city of Portugal, capital of the province of Algarve, is situated in a plain at the mouth of the Fermoso, in lat. 37° n., and long. 7° 52′ west. It has, on the whole, a modern aspect, but its houses are not handsome, and its streets are in general narrow. It is surrounded with walls, which are said to have been built by the Moors. The harbor of F. is somewhat confined, but the road formed by three islands at the mouth of the river affords good anchorage. F. has considera ble exports of oranges, figs, anchovies, and cork. It has also a prosperous fishery. Pop. 7,900. The number of blind people here met with is surprising, groups of five and six together being frequently observed. This is accounted for by the light sandy soil which prevails

FARO, or PHARO, a game at cards of the nature of hazard, played chiefly at gambling establishments. See Hoyle's *Games*.

FAROCHON, JEAN BAPTISTE EUGÈNE, b. Paris, 1807; a medalist and sculptor, pupil of David. He studied in Italy as a pensioner of the academy, and on returning to France gained a good reputation for his medallions. He became professor in the school of the fine arts in Paris, 1863.

FARÖE ISLES (Dan. *Faar-Oen*, sheep-islands), a group of islands, 22 in number, of which 17 only are inhabited, belonging to Denmark, and lying nearly midway between the Shetlands and Iceland, between 61° 25′ to 62° 25′ n. lat., and 6° to 8° w. long. The principal island, Stromoe (capital, Thorshavn), is 27 m. long, and 8 m. broad; those next in importance are Osteroe, Vaagoe, Bordoe, and Sudaroe. Their entire area is nearly 500 sq.m.; pop. about 8,500. The F. I. consist of basaltic elevations, none of which attain a height of 3,000 ft., and trap formations, covered with a thin vegetable soil, which yields pasturage to the cattle and numerous sheep which are reared in the islands. There are no considerable valleys or streams, but small fresh-water lakes are numerous. The coasts, which are steep and lofty, are broken by deep inlets, whirlpools, and rapids, which render navigation perilous. The furious hurricanes which prevail, prevent the growth of trees, or even of most of the ordinary vegetables and cereals; but the climate is so greatly modified by oceanic influences, that, notwithstanding the high latitude, snow rarely lies long on the ground, and the cattle can pass the greater

part of the year in the open air. Peat and coal are used for fuel; traces of iron and copper, and opal, chalcedony, etc., are found. The chief sources of wealth are flocks of sheep, and the multitudes of sea-fowl which frequent the rocks. The islanders show considerable skill in climbing the dangerous cliffs in search of birds, and they are also expert in fishing for seals and whales. Their manufactures are of the homeliest kind, but in return for the numerous articles supplied to them by the mother-country, they yield tallow, train-oil, feathers, skins, and butter, to the Danish markets. The people are of Norwegian origin, a vigorous, laborious, loyal, and religious race, and belong to the Lutheran church. They are governed by a Danish *amtmand*, or bailiff, and a landvogt, or director of the police and municipal departments, and are represented in the Danish legislature by a deputy appointed by the king. The islands, which were discovered in the 9th c. by Norwegians, have belonged to Denmark since the incorporation of Norway with that kingdom by the union of Calmar, and the language of the people is only a slightly modified form of the old Norse. England held the islands from 1807 to the treaty of Vienna, in 1814. Some account of the F. I. will be found in prof. sir Wyville Thomson's book, *The Depths of the Sea* (Macmillan & Co., 1873).

FAR'QUHAR, GEORGE, was b. at Londonderry in 1678, and received his education at the Dublin university, where, although he did not take any degree, he secured among his comrades the reputation of a wit who was a spendthrift of his witticisms. When he left the university, he was engaged as an actor by one of the Dublin theaters, but, like most dramatists who have figured on the stage, he proved but an indifferent performer. Playing a part in Dryden's *Indian Emperor*, and forgetting that he wore a sword instead of a foil, he accidentally wounded a brother-performer, and was so shocked by the occurrence that he at once quitted the boards. Accompanied by the actor Wilks, he proceeded to London, and shortly after received a commission in the regiment commanded by the earl of Orrery, which was then stationed in Ireland. Urged by Wilks, and perhaps stimulated by the gayety and leisure of military life, he, in 1698, produced his first comedy, entitled *Love and a Bottle*, which proved a success. Two years afterwards his *Constant Couple* appeared, which met with a brilliant reception, and to which he wrote a sequel, called *Sir Harry Wildair*. In 1703, he produced *The Inconstant*, founded on the *Wild-goose Chase* of Beaumont and Fletcher, a version in which all the coarseness, and none of the poetry, of the elder dramatists is retained. He married in the same year, and falling into serious pecuniary difficulties he sold his commission, and, struggling with adverse fortune, succumbed. He died of decline in 1707, leaving "two helpless girls" to the care of his friend Wilks. During his last illness, he wrote the best of his plays, *The Beau's Stratagem*—in six weeks, it is said—and died while its wit and invention were making the town roar with delight.

F. is one of the finest of our comic dramatists, although Pope called him a "farce writer." He is less icily brilliant than Congreve, and possesses on the whole more variety of character than any of his compeers. He had wit in abundance, but he had humanity too. He was a tender-hearted and somewhat melancholy man, and—what was rare in his school and in his time—*tears* are found glittering among the brilliants of his fancy.

FARR, WILLIAM, M.D., F.R.S., an eminent statistician, was b. at Kenley, in Shropshire, Nov. 30, 1807, became an assistant-surgeon at the Salop infirmary in 1826, and after attending privately the medical and scientific classes of the day, went to Paris university in 1829, where he attended the lectures of the most eminent medical professors. In 1831, he returned to England, and became a member of the university of London, where he completed his professional curriculum. F. has devoted himself mainly to a consideration of the important questions resulting from medical statistics. At first, he found it very difficult to draw the attention either of the public or of medical societies to the subject; but in the year 1837, his article, "Vital Statistics," in McCulloch's *Statistics of the British Empire*, obtained the notice and approval of certain influential persons. In the same year, the registration of all the deaths, and of the causes of death, was commenced in England, and in 1838, F. received an appointment in the general registrar's office. Since then, he has been made superintendent of a statistical department, the members of which have drawn up the new *London Tables of Mortality*, the *Quarterly Returns of Births, Deaths, and Marriages*, and the *Annual Abstracts*. In 1851, 1861, and 1871, he was employed in taking the census of Great Britain. In 1872, he was chosen a corresponding member of the French institute. F. is the author of a new *Statistical Nosology*, and of various valuable papers on the finance of life assurance, the income tax, the public health, etc.

FARRAGUT, DAVID GLASCOE, an American naval officer, was b. near Knoxville, Tenn., in 1801. In 1862, he was appointed to the command of a naval expedition to act against the confederates in the gulf of Mexico, and received the surrender of New Orleans. He afterwards took Natchez; and in 1863, he aided gen. Grant in the combined attack on Vicksburg, which resulted in its capitulation. In 1864, after a furious engagement between his fleet and the confederate forts and vessels at Mobile, he succeeded in capturing the forts, which led to the fall of the city. In 1866, he attained the rank of admiral, and a purse of $50,000 was presented to him. F. died in 1870.

palace. 4. The *Farnese Hercules*, copied by Glykon from an original by Lysippus. It exhibits the hero, exhausted by toil, leaning upon his club; the muscles and veins are still swollen, the head inclined, the expression melancholy; one hand rests upon his back and grasps one of the apples of the Hesperides.

FARNHAM, a t. in the w. of Surrey, on the left bank of the Wey, 10 m. w.s.w. of Guildford. It consists chiefly of one street running e. and west. The principal feature is the stately old castle of the bishops of Winchester, first built by bishop de Blois, brother of king Stephen. The castle was razed by Henry III., rebuilt and garrisoned by Charles I., and restored in 1684 to its present state by bishop Morley. It is an embattled quadrangle of brick, covered with stucco. A new town-hall was erected in 1866. F. has belonged to the bishops of Winchester since 860, when Ethelbald of Wessex bestowed it on them. Some parts of the parish church were built in the 12th, 15th, and 16th centuries. The chief trade is in hops, a very fine variety of which is grown in the vicinity. Pop. '71, 4,461. William Cobbett was born and is buried here. The vicinity of Aldershott camp, which is only about 6 m. to the n. of F., has increased the activity of the town

FARNHAM, Eliza Woodson (maiden name Burhans), 1815–64; b. N. Y.; married in Illinois to Thomas J. Farnham, the traveler. In 1841, she returned to New York, visited prisons, and lectured to the women convicts until 1844. She was four years matron of the Sing Sing state prison. In this period she published *Life in Prairie Land*, and edited Samson's *Criminal Jurisprudence*. In 1848, she was connected with the Boston institution for the blind. She was in California from 1849 to 1856, then returned to New York, and published *California, Indoors and Out*. *My Early Days* appeared in 1859, and in that year she organized a society to aid and protect destitute women in emigration to the west. *Woman and Her Era* was published in 1864.

FARNHAM, Ralph, 1756–1861; b. Me.; a soldier in the revolution, and the last survivor of the battle of Bunker hill. He was the first settler in Acton, Me. He lived 104 yrs. 5 ms. and 19 days. About a year before his death he was complimented by a grand concert in Tremont temple, Boston.

FARNHAM, Thomas Jefferson, 1804–48; b. Vt. In 1839, he led a small expedition across the continent to Oregon. In California, the same year, he procured the release of a large number of American and English prisoners from the Mexican government. His *Travels in Oregon Territory* appeared in 1842; *Travels in California* and *Scenes on the Pacific*, in 1845; a *Memoir of the North-west Boundary Line*, and *Mexico, its Geography, People, and Institutions*, in 1848.

FARN'WORTH, a t. of Lancashire, 2½ m. s.e. from Bolton-le-Moors, near the Tonge, a branch of the Irwell. It is a station on the Manchester and Bolton railway. It has a picturesque embattled chapel, of the 15th century. The manufacture of sail-canvas, watches, files, etc., is carried on. Pop. '71, 13,550.

FA'RO, a pleasant and wealthy episcopal city of Portugal, capital of the province of Algarve, is situated in a plain at the mouth of the Fermoso, in lat. 37° n., and long. 7° 52′ west. It has, on the whole, a modern aspect, but its houses are not handsome, and its streets are in general narrow. It is surrounded with walls, which are said to have been built by the Moors. The harbor of F. is somewhat confined, but the road formed by three islands at the mouth of the river affords good anchorage. F. has considerable exports of oranges, figs, anchovies, and cork. It has also a prosperous fishery. Pop. 7,900. The number of blind people here met with is surprising, groups of five and six together being frequently observed. This is accounted for by the light sandy soil which prevails

FARO, or Pharo, a game at cards of the nature of hazard, played chiefly at gambling establishments. See Hoyle's *Games*

FAROCHON, Jean Baptiste Eugène, b. Paris, 1807; a medalist and sculptor, pupil of David. He studied in Italy as a pensioner of the academy, and on returning to France gained a good reputation for his medallions. He became professor in the school of the fine arts in Paris, 1863.

FARÖE ISLES (Dan. *Faar-Oen*, sheep-islands), a group of islands, 22 in number, of which 17 only are inhabited, belonging to Denmark, and lying nearly midway between the Shetlands and Iceland, between 61° 25′ to 62° 25′ n. lat., and 6° to 8° w. long. The principal island, Stromoe (capital, Thorshavn), is 27 m. long, and 8 m. broad; those next in importance are Osteroe, Vaagoe, Bordoe, and Sudaroe. Their entire area is nearly 500 sq.m.; pop. about 8,500. The F. I. consist of basaltic elevations, none of which attain a height of 3,000 ft., and trap formations, covered with a thin vegetable soil, which yields pasturage to the cattle and numerous sheep which are reared in the islands. There are no considerable valleys or streams, but small fresh-water lakes are numerous. The coasts, which are steep and lofty, are broken by deep inlets, whirlpools, and rapids, which render navigation perilous. The furious hurricanes which prevail, prevent the growth of trees, or even of most of the ordinary vegetables and cereals; but the climate is so greatly modified by oceanic influences, that, notwithstanding the high latitude, snow rarely lies long on the ground, and the cattle can pass the greater

part of the year in the open air. Peat and coal are used for fuel; traces of iron and copper, and opal, chalcedony, etc., are found. The chief sources of wealth are flocks of sheep, and the multitudes of sea-fowl which frequent the rocks. The islanders show considerable skill in climbing the dangerous cliffs in search of birds, and they are also expert in fishing for seals and whales. Their manufactures are of the homeliest kind, but in return for the numerous articles supplied to them by the mother-country, they yield tallow, train-oil, feathers, skins, and butter, to the Danish markets. The people are of Norwegian origin, a vigorous, laborious, loyal, and religious race, and belong to the Lutheran church. They are governed by a Danish *amtmand*, or bailiff, and a landvogt, or director of the police and municipal departments, and are represented in the Danish legislature by a deputy appointed by the king. The islands, which were discovered in the 9th c. by Norwegians, have belonged to Denmark since the incorporation of Norway with that kingdom by the union of Calmar, and the language of the people is only a slightly modified form of the old Norse. England held the islands from 1807 to the treaty of Vienna, in 1814. Some account of the F. I. will be found in prof. sir Wyville Thomson's book, *The Depths of the Sea* (Macmillan & Co., 1873).

FAR'QUHAR, GEORGE, was b. at Londonderry in 1678, and received his education at the Dublin university, where, although he did not take any degree, he secured among his comrades the reputation of a wit who was a spendthrift of his witticisms. When he left the university, he was engaged as an actor by one of the Dublin theaters, but, like most dramatists who have figured on the stage, he proved but an indifferent performer. Playing a part in Dryden's *Indian Emperor*, and forgetting that he wore a sword instead of a foil, he accidentally wounded a brother-performer, and was so shocked by the occurrence that he at once quitted the boards. Accompanied by the actor Wilks, he proceeded to London, and shortly after received a commission in the regiment commanded by the earl of Orrery, which was then stationed in Ireland. Urged by Wilks, and perhaps stimulated by the gayety and leisure of military life, he, in 1698, produced his first comedy, entitled *Love and a Bottle*, which proved a success. Two years afterwards his *Constant Couple* appeared, which met with a brilliant reception, and to which he wrote a sequel, called *Sir Harry Wildair*. In 1703, he produced *The Inconstant*, founded on the *Wild-goose Chase* of Beaumont and Fletcher, a version in which all the coarseness, and none of the poetry, of the elder dramatists is retained. He married in the same year, and falling into serious pecuniary difficulties he sold his commission, and, struggling with adverse fortune, succumbed. He died of decline in 1707, leaving "two helpless girls" to the care of his friend Wilks. During his last illness, he wrote the best of his plays, *The Beau's Stratagem*—in six weeks, it is said—and died while its wit and invention were making the town roar with delight.

F. is one of the finest of our comic dramatists, although Pope called him a "farce writer." He is less icily brilliant than Congreve, and possesses on the whole more variety of character than any of his compeers. He had wit in abundance, but he had humanity too. He was a tender-hearted and somewhat melancholy man, and—what was rare in his school and in his time—*tears* are found glittering among the brilliants of his fancy.

FARR, WILLIAM, M.D., F.R.S., an eminent statistician, was b. at Kenley, in Shropshire, Nov. 30, 1807, became an assistant-surgeon at the Salop infirmary in 1826, and after attending privately the medical and scientific classes of the day, went to Paris university in 1829, where he attended the lectures of the most eminent medical professors. In 1831, he returned to England, and became a member of the university of London, where he completed his professional curriculum. F. has devoted himself mainly to a consideration of the important questions resulting from medical statistics. At first, he found it very difficult to draw the attention either of the public or of medical societies to the subject; but in the year 1837, his article, "Vital Statistics," in McCulloch's *Statistics of the British Empire*, obtained the notice and approval of certain influential persons. In the same year, the registration of all the deaths, and of the causes of death, was commenced in England, and in 1838, F. received an appointment in the general registrar's office. Since then, he has been made superintendent of a statistical department, the members of which have drawn up the new *London Tables of Mortality*, the *Quarterly Returns of Births, Deaths, and Marriages*, and the *Annual Abstracts*. In 1851, 1861, and 1871, he was employed in taking the census of Great Britain. In 1872, he was chosen a corresponding member of the French institute. F. is the author of a new *Statistical Nosology*, and of various valuable papers on the finance of life assurance, the income tax, the public health, etc.

FARRAGUT, DAVID GLASCOE, an American naval officer, was b. near Knoxville, Tenn., in 1801. In 1862, he was appointed to the command of a naval expedition to act against the confederates in the gulf of Mexico, and received the surrender of New Orleans. He afterwards took Natchez; and in 1863, he aided gen. Grant in the combined attack on Vicksburg, which resulted in its capitulation. In 1864, after a furious engagement between his fleet and the confederate forts and vessels at Mobile, he succeeded in capturing the forts, which led to the fall of the city. In 1866, he attained the rank of admiral, and a purse of $50,000 was presented to him. F. died in 1870.

FARRAKHÁBÁD, or FURRUCKABAD, a district in the Agra division of the n.w. provinces of British India; a flat alluvial plain on the Ganges, which has a course through and along the district of 87 m.; 1744 sq.m.; pop. '72, 918,748; Hindus, 816,733; Mohammedans, 101,538; Christians, 477. Chief products, rice, wheat, barley, millet, pulse, cotton, sugar-cane, and potatoes. The chief town, on the Ganges, bears the same name.

FARRANT, RICHARD, a composer of English church-music in the 16th c., of whose life little is known. Among the most admired of his compositions are the anthems *Call to Remembrance* and *Hide not thy Face*. He is credited on insufficient proof with being the author also of *Lord, for thy Tender Mercies' Sake*.

FARRAR, ELIZA WARE, 1791–1870; a daughter of Benjamin Rotch of New Bedford, Mass.; b. Flanders (Europe); in 1828, married prof. John Farrar of Harvard college. She was the author of *Congo in Search of his Master; Children's Robinson Crusoe; The Story of Lafayette; The Life of Howard; Youth's Letter-Writer; Young Lady's Friend;* and *Recollections of Seventy Years*. Her later years were spent in Springfield, Mass.

FARRAR, FREDERIC WILLIAM, D.D., b. Bombay (India), 1831; graduate of Cambridge, Eng.; master of Marlborough college in 1871; and was made chaplain in ordinary to the queen. He has published *Eric; Julian Home;* and *St. Winifred's*. His philological works are *The Origin of Language; Chapters on Language; Greek Grammar Rules; Greek Syntax;* and *Families of Speech*. His theological works are *Seekers after God; The Silence and Voices of God; The Witness of History to Christ* (the Hulsean lectures for 1870 before the university of Cambridge); and *The Life of Christ*, which, among the many recent works on the same theme, is of great importance and interest as the matured production of one who has lovingly studied the Scripture testimony concerning Christ, aided by the lights of literature and discussion, as well as by his own sojourn in the land where that life was lived; and who, with faith in the manifestation of Christ's divine work through nearly 19 centuries, seeks in the words and works recorded in the gospels the causes which awakened faith in Christ before the Christian history had been developed or the Christian name known. *The Life and Work of St. Paul*, from this author, is a companion work to the preceding. His *Eternal Hope*, a book not so much of argument as of glowing rhetoric, while not professing to invalidate the received doctrine of the church regarding the future of the ungodly, has met severe criticism as tending to reduce at least the stringency of the application of those doctrines.

FARRAR, JOHN, LL.D., 1779–1853; b. Mass.; graduated at Harvard in 1803, and studied theology at Andover; was Greek tutor at Harvard in 1805; in 1807, became Hollis professor of mathematics and natural philosophy. He published a translation of Lacroix's *Elements of Algebra*, and contributed many articles to scientific periodicals. In consequence of ill health he resigned his chair in 1836.

FARRAR, TIMOTHY, LL.D., 1747–1849; born Mass.; graduated at Harvard college, 1767. He settled in New Hampshire and taught school about 1770. He was a maj. in the American army in the revolution, was a justice of the common pleas for 40 years. In 1842, he was appointed chief-justice of New Hampshire. He was also a member of the new Hampshire constitutional convention, and one of the committee which drafted the constitution.

FARREN, ELIZA, Countess of Derby, 1759–1829; an English actress, playing with great success in the London theaters in the latter part of the last century. In 1797, she married the 12th earl of Derby, a widower.

FARRER, HENRY, b. London, England, 1843; an artist in water colors, residing in New York; brother of Thomas Charles Farrer.

FARRER, THOMAS CHARLES, b. London, 1838; an English artist; studied drawing in Ruskin's free school, and in 1858 came to the United States. In the war of the rebellion he served in the union ranks as a private. Soon after the war he returned to England, where he still resides.

FARRIER (from *ferrum*, iron), a person who shoes horses and treats their diseases. The better class of farriers often were, and indeed still are, men of great shrewdness and observation, sometimes possessing considerable experience, and with skillful, useful hands. Their management of sick horses is occasionally sensible, but generally altogether empirical. They have usually but crude ideas of the structure, functions, or diseases of animals, and pin their faith mainly on a few carefully cherished recipes. To their calling as horse-doctors and shoeing-smiths (see SHOEING), they usually unite those of cow-leech and cutter of colts and pigs, and although still met with in many of the rural districts of England and Ireland, their practice is passing into the hands of regularly educated veterinarians. See VETERINARY MEDICINE.

FARRIERS, ARMY. Farriers-major and farriers are non-commissioned officers in the cavalry, artillery, engineers, and military train, whose duty it is to shoe the horses of their corps, and, generally, to assist the veterinary surgeon in exercising a proper care over the regimental animals. They receive the same pay as other sergeants (with whom they rank); and, in addition, certain allowances proportionate to the number of animals in charge. The sum necessary to defray this allowance for a year is about £10,000.

FARRIERY. See FARRIER and HORSESHOEING, *ante.*

FARS, or FARSISTAN (anciently *Persis*), a province of Persia, on the e. shore of the Persian gulf, lying between lat. 27° 30′ and 31° 30′ n., and between long. 49° 30′ and 55° east. The coast region is flat, with a hot climate; inland, the ground rises to an elevation of from 2,000 to 3,000 ft., the climate is cooler, and valleys, alike remarkable for their beauty and fertility, ranging from 15 to 100 m. in length, are numerous. East of this hilly district the province again become flat and sandy; and here occurs the large salt-lake Bakhtegan. The chief rivers are the Bundemeer (anciently Araxes), the Nabon, and the Tab (anciently Arosis). The province produces tobacco, wine, rice, dates, opium, linen, cotton, silk, cochineal, and roses for the manufacture of attar. It has iron and lead mines, marble and alabaster qurries, and yields also borax and naphtha. It trades mainly with India. The principal towns are Shiraz, Jehroom, Darab or Darabgerd, Behbehan or Babahan, and Bushire. North of Shiraz, at a distance of about 30 m., lie the ruins of the ancient and splendid city of Persepolis. F. also contains the remains of Shahpur, a city older than the age of Alexander the great, and the celebrated sculptured rocks, called by the Persians *Naksh-i-Rustam.* A cold winter and heavy floods prevailed in 1873–74, which caused great damage to property; neerly one third of the city of Shiraz was destroyed by the floods.

FARSAN′ ARCHIPEL′AGO, a group of islands in the s.e. of the Red sea, the chief of which are Farsan Kebeer, 31 m. long, and Farsan Seggeer, 18 m., in lat. 16° 30′ to 17° n., and long. 41° 45′ to 42° 10′ east. They would be valuable as harbors, were it not for the reefs in the vicinity.

FARTHING (Sax. *feorthung,* from *feorth;* fourth), the fourth part of a penny (q.v).

FARTHINGALE, old form of the word (as found in bishop Latimer) *verdingale,* is probably a corruption of the French *vertugade,* which is itself a corruption of *vertugarde,* signifying guard of modesty. For a description of the F., see CRINOLINE.

FARYNDON INN, the name formerly borne by Sergeants' inn, Chancery lane. This building belonged to the bishops of Ely, by whom, in 1411, it was left to the sergeants-at-law. In 1484, the name was changed to Sergeant's inn (q.v.).

FASA′NO, a t. of Italy, in the province of Bari, and 33 m. s.e. of the town of Bari, is situated on the high-road from that town to Brindisi. It is small, but wealthy. The whole of the district of F. abounds in olive plantations, and there are numerous oil-presses in the town and neighborhood. Pop. '71, 12,809.

FAS′CES were bundles of rods usually made of birch, but sometimes of elm, with an axe projecting from the middle of them, which were carried before the chief magistrates of ancient Rome, as symbols of their power over life and limb. They were borne by the lictors, at first before the kings; in the time of the republic, before consuls and prætors; and afterwards before the emperors. Their number varied, a consul having twelve, and a prætor six; but within the city only two. Valerius Publicola introduced a law that within the city the axe was withdrawn, except in the case of a dictator, who was preceded by 24 lictors, bearing as many fasces. Publicola also made the F. be lowered at the assemblies of the people, as an acknowledgment of their supreme power.

FAS′CIA, in architecture, a flat space or band, like a broad ribbon, usually between moldings of the architrave. Architraves are called single, double, or triple fasciæ architraves, according to the number of fasciæ into which they are divided.

FASCINATION BY SERPENTS. A power has long been popularly ascribed to serpents, or at least to some kinds of them, of fascinating by their eye the small animals on which they prey, so as to prevent the escape of the intended victim, when its escape would otherwise be easy, and to cause it rather to run or flutter into the mouth which is open to devour it. This popular notion has been ridiculed, but is supported by a large amount of evidence, and has been fully adopted by some of the most scientific observers. In the earlier part of last century, Kalm described the rattlesnake as frequently lying at the bottom of a tree, on which a squirrel is seated, and fixing its eyes on the little animal, which from that moment cannot escape, but begins a doleful outcry, comes towards the snake, runs a little bit away, comes nearer, and finally is swallowed. Le Vaillant describes a similar scene, as witnessed by him in Africa, a shrike incapable of moving away from a serpent which was gazing fixedly at it, and dying of fear, although the serpent was killed. Dr. Andrew Smith states that the presence of a non-venomous South African tree-snake, *bucephalus viridis,* in a tree, causes the birds of the neighborhood to collect around it and fly to and fro, uttering piercing cries, "until some one, more terror-struck than the rest, actually scans its lips, and almost without resistance, becomes a meal for its enemy." He adds, "whatever may be said in ridicule of fascination, it is nevertheless true that birds, and even quadrupeds, are, under certain circumstances, unable to retire from the presence of certain of their enemies; and what is even more extraordinary, unable to resist the propensity to advance from a situation of actual safety, into one of most imminent danger. This I have often seen exemplified in the case of birds and snakes; and I have heard of instances equally curious, in which antelopes and other quadrupeds have been so bewildered by the sudden appearance of crocodiles, and

by the grimaces and contortions they practiced, as to be unable to fly, or even move from the spot towards which they were approaching to seize them." Ellis, in his *Three Visits to Madagascar*, records anecdotes of the same kind, and one in particular, of a frog apparently unable to move, until an object was pushed between it and the eye of the snake, when the frog immediately darted away, as if relieved from some mesmeric influence exerted over it.

FASCI'NES (from Lat. *fascis*, a bundle) are fagots for military purposes made of young branches of trees or brushwood, and also of osiers, bound together with yarn or withes. They are about a foot in diameter, and of various lengths, averaging 12 ft., according to the object for which they are intended. F. are used in the construction of temporary works; for filling a ditch, and sometimes, in a pile, for setting fire to an obstruction. Before a siege, the soldiers are employed in making F. in great number; and when needed, each soldier bears one to the place, casts it on the heap, and the quantity required is thus accumulated in a remarkably short time.

FASCI'OLA, a generic name formerly employed to designate all the *trematode entozoa*, as flukes, etc., which are now, however, divided into many genera.

FASHION, or, as the French term it, *la mode*, admits as little of exact definition as of being referred to any intelligible principle. In every age and country, there has been a recognizable costume or general style of male and female attire, along with certain niceties in the shape, color, and texture of dress, which, fluctuating according to taste or whim, are known as the F.—a word which etymologically signifies making in a particular form. The terms F. and fashionable are, however, so comprehensive as to include much beyond the sphere of the toilet; as, for example, a style of speaking, living, and forming opinions; there being, to use a common phrase, "a fashion in everything." It is only in China and some other eastern countries that, in consequence of dress being regulated by sumptuary laws or some equally strict traditions, the fashions of attire remain from generation to generation with little or no change.

The nature of clothing, and the necessity for its use, being treated in the articles WEAVING and SANITARY SCIENCE, what seems desirable here is to glance at the leading forms of dress and more conspicuous fashions that have prevailed in western Europe, and more particularly in England, since the dawn of civilization. Our modern costume has seemingly had a double origin—that of the Romans and of the Teutonic people, who in different branches invaded France and Britain. The usual Roman dress, in the latter period of the empire, consisted of a tunic, or loose upper garment, with a dress for the lower limbs, called *braccæ;* hence the modern term *breeches*. Over all was occasionally worn by the higher classes the *toga*, or mantle. It is believed that these Roman costumes were generally copied by the greater number of British, at least among the more opulent classes. In the dress of the women, however, there was but little change. They appear in two tunics, the one reaching to the ankles, the other having short sleeves, and reaching about half-way down the thigh: in other words, they resemble a round gown, or bedgown and petticoat, though the latter, distinct from a body and sleeves, is not considered to be ancient. This tunic was called in British *gwn;* hence our word *gown*, of which we still see specimens of short dimensions worn by women of the humbler classes in England, Scotland, and Wales.

The Anglo-Saxon and Danish periods of English history are marked by new peculiarities in costume. Soon after the departure of the Romans, and the arrival of the Saxons in the 5th c., fashions of apparel were introduced from northern Germany, which continued with no material change for several centuries. The most important improvement in the ordinary dress of the people was the introduction of the *shirt*, a linen garment worn next the skin, for which we are indebted to the Saxon invaders. The common dress of the 8th c. consisted, as we find, of linen shirts; tunics, or a kind of surcoat; cloaks fastened on the breast or shoulders with brooches; short drawers met by hose, over which were worn bands of cloth, linen, or leather, in diagonal crossings. Leathern sandals were worn by the early Anglo-Saxons; but afterwards the shoe became common: it was very simple, and well contrived for comfort, being opened down the instep, and there, by a thong passed through holes on each side of the slit, drawn tight round the feet like a purse. A felt or woolen cap, called *hæt* (hence our modern word *hat*), was worn by the higher class of Anglo-Saxons; but it is generally believed that the serfs or lower orders were without any other covering for the head than what nature had given them. The Anglo-Saxon tunic still exists in the *smock-frock*, a species of overall generally worn by the peasantry and some farmers in England. The *blouse*, worn by workmen in France and Switzerland, has an equally early origin.

The Norman conquest introduced greater taste and splendor into British costume. Now, were introduced gloves (q.v.), along with the fashions of chivalry. A gentleman of the reign of Henry V. was dressed in a short tunic, buttoned in front, with girdle, large loose sleeves, tight hose forming pantaloons and stockings in a single piece, peaked shoes, and head-cloth or cap. About this period, silks and velvets of divers colors came into use among the higher classes, by whom gold chains were generally worn. The dress of ladies was of the richest kind. Gowns were embroidered and bordered with furs or velvet; and the bodice, laced in front over a stomacher, now first appeared. But the greatest eccentricity was the lofty steeple head-dress; this consisted of a roll of

linen, covered with fine lawn, which hung to the ground, or was mostly tucked under the arm.

In the 16th c., the upper part of the long hose or nether garments began to be worn loose, or slashed with pieces of different colors let in, and the arms and shoulders of the doublet or jacket were fashioned in a similar style. Boots were also worn loose on the leg, with the upper part falling down; hence the origin of the *buskin*. Ruffs or ruffles, collars, and velvet bonnets with feathers, came likewise into use, as may be seen from the paintings of Henry VIII. Hall, the chronicler, describes several of Henry's superb dresses, and among them a *frocke*, or coat of velvet, embroidered all over with gold of damask, the sleeves and breast cut and lined with cloth of gold, and tied together "with great buttons of diamonds, rubies, and orient pearls." The cloaks and mantles were of corresponding magnificence. The shirts were pinched or plaited, and embroidered with gold, silver, or silk. The term *hose* continued to be applied to the entire vestment, from the waist to the feet, throughout this century; the material is more distinctly stated, for Henry wore knit silk as well as cloth hose: the precise period of the separation of the hose into breeches and stockings, is not so clear as the derivation of the latter term from the "*stockying* of hose;" "that is, adding the lower part that covered the legs and feet to that which was fastened by points to the doublet," and was called the *stocks*. The shoes and buskins were of the German fashion, very broad at the toes, and of velvet and satin, slashed and puffed. The hats, caps, and bonnets were of almost endless forms and colors

The dress of the middle ranks in the reign of Henry VIII. may be seen in prints of the time; plain russet coats, and a loose kind of kersey breeches, with stockings of the same piece, were the ordinary suit; and the London apprentices wore blue cloaks in summer, and gowns of the same color in winter, as badges of servitude; for this appears to have been the age of domestic distinctions—the relics of the feudalism of the middle ages. The women wore russet, or long woolen gowns, worsted kirtles (hereafter called *petticoats*), and white caps and aprons, and white underlinen came into general wear.

The principal novelty of the reigns of Edward VI. and Mary was the flat round bonnet or cap, of plain velvet or cloth, worn on one side of the head, and decorated with a jewel and single ostrich feather. The bonnet itself is preserved in the caps worn at the present day by the boys of Christ's hospital; and their blue coat and yellow stockings are such as were worn by the London apprentices at the date of the foundation of the hospital by the youthful Edward. See HOSIERY.

The male costume in Elizabeth's reign was the large trunk hose, long-waisted doublet, short cloak, hat, band, and feather, shoes with roses, and the large ruff; but the great breeches, "stuffed with hair-like woolsacks," after the separation of the hose into this garment and stockings, appear to have been worn throughout the reign; they were made of silk, velvet, satin, and damask. The doublets were still more costly, and quilted and stuffed, "slashed, jagged, pinched, and laced;" and over these were worn coats and jerkins in as many varieties as there are days in the year. The cloaks were of the Spanish, French, and Dutch cuts, of cloth, silk, velvet, and taffeta of all colors, trimmed with gold, silver, and silk-lace and glass bugles, inside and outside equally superb. The stockings, shoes, slippers, and ruffs resembled those of the ladies.

Hats now began to supersede the bonnets of a former era. Those of beaver were exceedingly expensive, and they were for the most part made of felted wool, dyed. The most remarkable thing about these hats was their numerous shapes; some were steeple-crowned; others were flat and broad, like the battlements of a house; and others with round crowns, and bands of all colors, and ornamented with huge feathers, and brooches, clasps, and jewels of great value. See HAT.

As regards female attire, the more conspicuous features in the reign of Elizabeth were the farthingale (q.v.) and ruff. The farthingale, or fardingale, consisted in an extravagant expansion of the lower garments, by means of cane or whalebone, by which the lady seemed to walk in a kind of tub. The farthingale, which is referred to by Shakespeare, Butler, and other writers, mostly in a satiric vein, was the predecessor of the hoop, which in its turn, after an interval, was succeeded by the crinoline (q.v.) and hoop-work of steel. The widely extended ruff of fine linen, like a huge frill, is seen in the pictures of Elizabeth and her envied rival, Mary queen of Scots, both stars of F. in their day.

Under James I., the male costume was somewhat more Spanish, as respects the slashing and ornamenting of the doublet and breeches. Late in the reign, however, the jackets or doublets were shortened, and the breeches reduced in size, and fastened in large bows at the knees; the well-stockinged leg was admired, and the hat worn low in the crown, and with broad brim, as seen in portraits of the date 1619. Beards and whiskers had become almost universal in the reign of Elizabeth; but in that of James, the former was sometimes worn trimmed to a point, hanging down at the division of the ruff.

In the female costume, there was little change. The farthingale continued to be worn by ladies of quality; a strong passion for foreign lace was introduced; pearls were the favorite jewels; and the ruff maintained its sway, so as to be anathematized from the pulpit; and the fancies of female costume were glanced at in a sermon preached before the king at Whitehall in 1607-8, as "her French, her Spanish, and her foolish fashions."

The F. of dress in the reign of Charles I. became still more decidedly Spanish and picturesque. There were now worn collars of rich point-lace, large and hanging down on the shoulders, held by a cord and tassel at the neck, and now called *Vandyke*, from its being the most striking part of the dress in which Vandyke at that time painted portraits.

The principal habits were vests and cloaks of velvet, or silk damask, short-trousered breeches terminating in stuffed rolls, and fringes and points, and very rich boots, with large projecting lace tops. A dress of Charles is thus described: A falling band, green doublet (from the armpits to the shoulders wide and loose), zigzag turned-up ruffles, long green breeches (like a Dutchman's), tied below the knee with yellow ribbons, red stockings, green shoe-roses, and a short red cloak lined with blue, with a star on the shoulder; the king sometimes wore a large cravat, and at other times a long falling band with tassels. The dress of the gay courtiers or cavaliers consisted of a doublet of velvet, silk, or satin, with large loose sleeves, slashed, and embroidered; Vandyke collar and band, and short embroidered cloak, worn on one shoulder; the long breeches, fringed and pointed, met the ruffled tops of the boots; the embroidered sword-belt was worn over the right shoulder, and in it was hung a Spanish rapier, and in the flapping beaver hat was worn a plume of feathers confined by a jewel. A buff coat or jerkin was often worn, as a better defense than the doublet, which it sometimes covered.

The female costume of this period was rather elegant than splendid. Gowns with close bodics and tight sleeves were worn, though the farthingale was retained, with a gorget ruff standing up about the neck like a fan. French hoods were still worn, though with little distinction as to rank. The hair was worn in small curls, and the hoods, of all colors, fastened under the chin with curious effect. Ear-rings, necklaces, and bracelets were much worn; but the Puritans forbade the females to wear lace, jewels, or even braided hair; and they retained the close hood and high-crowned hat.

Towards the close of the reign of Charles I., the cumbrous farthingale disappeared, with the yellow starched ruff and band. These tasteless fashions being dismissed, the female dress became very elegant, with its rich full skirt and sleeves, and falling collar edged with rich lace, and the hair worn in graceful ringlets; but these vanities were condemned by the Puritan party.

With the restoration of Charles II. came certain tasteless innovations upon the elegant Vandyke costume of the time of Charles I., which were the first resemblance to the coats and waistcoats of the present day. Thus our most picturesque attire lasted little more than a quarter of a century. Its decline was gradual; its chivalric character soon degenerated into grotesqueness, which in its turn changed to stark meanness. Early in the reign of Charless II., the doublet was much shortened, and worn open in front, where, and at the waistband, the rich shirt was shown; and the loose sleeves and breeches were decked with ribbons and points, and from the knee-bands hung long lace ruffles. At the wrists, too, ruffles were worn; but the lace-collar was shorn of its points. The cloak was retained upon the left shoulder, and the high-crowned and plumed hat remained for a short time; but the crown of the hat was soon lowered.

The petticoat breeches were another absurdity; although ornamented with ribbons at the sides, the lining strangely appeared below the breeches, and was tied at the knees; to match which, the sleeves of the doublet only reached to the elbows, and from under them bulged the ruffled sleeves of the shirt, both being ornamented with ribbons. Meanwhile the skirt of the doublet had been lengthened from above the waist nearly to the knees, and had buttons and button-holes in its entire length, thus becoming a *coat*, and so named in an inventory of 1679; wherein also are the items of *waistcoat*, *breeches*, *pantaloons*, *drawers*, and *trousers*, being the earliest mention of these articles. Stockings of various kinds were common; and "the lower ends of stockings" are understood as socks. Instead of the lace-collar was worn the long square-ended cravat, of the same material, from Brussels and Flanders.

Passing to the reigns of James II. and William III.; we find the male attire gradually fashioned according to the artificial costume of the court of Louis XIV. Every article of dress was now more prim and exact. The petticoat breeches were exchanged for the close-fitting garments tied below the knee, and therefore called *knee-breeches;* the broad-rimmed hats were turned up on two sides and edged with feathers or ribbons; we began to see the rich long lace cravat and embroidered waistcoat; and the band was now narrowed, so as to resemble that worn at the present time by clergymen. Wigs, which had been some time in use, were worn still longer than hitherto, hanging down in front, or flowing upon the shoulders, though the color was altered from black to suit the complexion. From the 17th to the end of the 18th c., was the era of *hair-powder* (q.v.), *wigs* (q.v.), and cocked-hats; in these as in other matters there being an excessive artificiality in the tastes of the higher classes. A gentlemen of 1750 might have been seen with his flowing coat and ample cuffs, frills at the wrist, deep waistcoat hanging over the legs, long white hose drawn over the knees, his cocked-hat folded under his arm, and in his hand an open snuff-box (q.v.). Such was the appearance of what is traditionally known as the "old English gentlemen." The coats of the 18th c. were of velvet, silk, or satin, as well as broadcloth, and their colors very fanciful. Hogarth's favorite color was sky-blue; Reynolds's deep crimson and violet; and Goldsmith rejoiced in plum-color. About 1790, cloth became the general wear; the waistcoat being of the

costlier materials, and embroidered, and sometimes the breeches. Buckles were worn at the knees and in the shoes till the close of the century; and the large square plated buckle was the *ton* until 1791, when shoe-strings became general. Among the artificialities of dress during the greater part of the 18th c., none was more odious than that of hoops (q.v.), worn by ladies, who, by these means of expansion, were made to appear as if standing in an inverted tub. In the reigns of George I. and II., a lose kind of drapery at the back of the dress, called a *sacque*, and hooded silk-cloaks, were worn, also a very small muff, such as have been lately revived. In the 18th c., after the disuse of towering head-dresses, veils (q.v.) of an elegant fabric were introduced, and the fan (q.v.) was an important article for ornament and flirtation.

The formalities of the 18th c. received a severe blow at the French revolution; and in the ten years from 1790 to 1800 a more complete change was effected in dress, by the spontaneous action of the people, than had taken place at any previous period in a century. The change began in France, partly to mark a contempt for old court usages, and partly in imitation of certain classes of persons in England, whose costume the French mistook for that of the nation generally. This new French dress was introduced by the party who were styled the sans culottes. It consisted of a round hat, a short coat, a light waistcoat, and pantaloons; a handkerchief was tied loosely round the neck, with the ends long and hanging down, and showing the shirt-collar above; the hair was cut short, without powder, *à la Titus*, and the shoes were tied with strings.

The comparatively simple form of dress of the sans culottes found many admirers in England, and soon became common among young men; the change from antique fashions was also greatly helped by the imposition of a tax on the use of hair-powder, which was henceforth generally abandoned. Pantaloons, which fitted closely to the leg, remained in very common use by those persons who had adopted them till about the year 1814, when the wearing of trousers, already introduced into the army, became fashionable. It is proper, however, to mention that trousers had, for the previous fifteen or twenty years, been used by boys, and were perhaps from them adopted by the army. Previous to the French revolution, the dress of boys was almost the same as that of men. Although trousers—called by the Americans *pants*—were generally worn after 1815, many elderly persons still held out in knee-breeches against all innovations, and to the present day an aged gentleman may occasionally be seen clinging to this 18th c. piece of dress. The general use of white neckcloths continued, notwithstanding the introduction of the standing collar, till the reign of George IV., when this monarch's taste for wearing a black silk kerchief or stock, and also the use of black stocks in the army, caused a remarkably quick abandonment of white neckcloths and the adoption of black instead. The year 1825, or thereabouts, was the era of this signal improvement in costume.

While these leading changes were effecting, other alterations of a less conspicuous nature were from time to time taking place. The disbanding of the army after the peace of 1815 led to various transformations besides those we have mentioned. While pantaloons were the fashionable dress, it became customary to wear Hessian boots; these, which had originated among the Hessian troops, were without tops, and were worn with small silk tassels dangling from a cut in front; being drawn over the lower part of the pantaloons, they had a neat appearance; but the keeping of them clean formed a torment that prevented their universal use. See Boots. When trousers were introduced from the practice of the army, the use of Wellington boots to go beneath them also became common. Referring to the era of 1815 to 1825 as that in which trousers, Wellington boots, and black neckcloths or stocks came into vogue, we may place the introduction of the surtout in the same period of history. From the time when the collarless and broad-skirted coat had disappeared about the commencement of the century, the fashion of coats had changed in various ways till the above-named era, when the loose frock-coat or surtout was added to the list of garments.

Such is the general account of the progress of fashions in England until nearly the present day. In these fashions, the Welsh, Irish, and Scotch have participated, and there is now little to distinguish the inhabitants of one part of the United Kingdom from another. What differences exist in particular localities—as, for instance, the round hats of the women in Wales, the checked gray *plaid* of the lowland Scottish peasantry, and the *tartan* of the highlanders—will receive some notice under their appropriate heads.

The general simplifying of dress subsequent to 1815, was not unaccompanied by an expiring effort to sustain a high style of fashion. The *macaroni*, or highly dressed beau of the 18th c., was now succeeded by the *dandy*, who, with mincing, affected manners, prided himself on his starched collars, his trousers-straps, and the flashy bunch of seals which dangled from his watch-chain. The regency was the era of this kind of supreme dandyism, but it continued till later times, and characterized a number of leading public personages, of whom notices occur in Raike's *Reminiscences*, from 1831 to 1851. In the present day, may be noted a kind of break-down of everything like formality in gentlemen's walking costume. Plain cloths, of divers hues, called Tweeds (q.v.), have almost superseded materials of a superior quality; cloth caps, or soft felted hats, called *wide-awakes* (see Hat), cover the head; and the feet are provided with short ankle-boots instead of Wellingtons. In the evening or dinner costume, however, the old etiquette of

dress-coats and white neck-cloths is still maintained. Among the changes that are taking place in the morning or walking dress, none is so remarkable as the growing fashion of wearing *knickerbockers*. These are wide loose trousers to below the knee, leaving the lower part of the leg only stockinged or covered with leggings. This fashion, which has been copied more immediately from the French zouaves (q.v.), and partly perhaps from the common practice of stuffing the lower parts of the trousers roughly into boots in the western regions of the United States, is very much a resumption of the costumes seen in old Dutch prints. Should it become general, leg-gaiters or boots will come again into use, and the present generation may live to see the fashion of male attire work once more round to the knee-breeches of the 18th century. In female as well as in male costume, fashion seems to have a tendency to work in a circle; of this, the late, but now obsolete, resumption of the farthingale, or hoop, under the name of crinoline, offers a sufficient example, besides affording a ludicrous instance of the unreasoning manner in which extravagances in dress are usually followed. It is to be observed, however, that Englishwomen, chargeable as they are with this absurdity, set a most creditable example to their sex all over the world, in allowing no fantastic change of fashion to prevent them from taking out-door exercise in all weathers, which the introduction of india-rubber goloshes (q.v.) has materially aided.

As to the moral view that may be taken of the whimsicalities of female fashions, we might refer to the numerous papers of Steele in the *Tatler* and *Spectator*, and also the writings of other 18th c. essayists; passing these over, it is enough to quote the words of Hazlitt, a more recent essayist. "fashion," he says, "constantly begins and ends in two things it abhors most—singularity and vulgarity. It is the perpetual setting up and then disowning a certain standard of taste, elegance, and refinement, which has no other formation or authority than that it is the prevailing distraction of the moment; which was yesterday ridiculous from its being new, and to-morrow will be odious from its being common. It is one of the most slight and insignificant of all things. It cannot be lasting, for it depends on the constant change and shifting of its own harlequin disguises; it cannot be sterling, for, if it were, it could not depend on the breath of caprice; it must be superficial, to produce its immediate effect on the gaping crowd; and frivolous, to admit of its being assumed at pleasure by the number of those who affect to be in the fashion, to be distinguished from the rest of the world. It is not anything in itself, nor the sign of anything, but the folly and vanity of those who rely upon it as their greatest pride and ornament. It takes the firmest hold of weak, flimsy, and narrow minds, of those whose emptiness conceives of nothing excellent but what is thought so by others. That which is good for anything is the better for being widely diffused. But fashion is the abortive issue of vain ostentation and exclusive egotism: it is haughty, trifling, affected, servile, despotic, mean and ambitious, precise and fantastical, all in a breath—tied to no rule, and bound to conform to every rule of the minute." For a large variety of amusing particulars concerning fashions, "stars of fashion," etc., during the past two centuries, we refer to Mrs. Stone's *Chronicles of Fashion* (Lond., 2 vols., 1845.)

W.C.

FAST (a word common to the Teutonic tongues, which Grimm derives from a root signifying primarily to hold, keep, observe, and hence to restrain one's self; Lat. *jejunium*, Gr. *nēstéia*, Hebr. *tsom*) is the word used to express a certain self-imposed restraint with respect to the nourishment of the body. The abstinence enforced may be either partial, when the restriction is confined to certain articles of food; or total, when all sustenance is dispensed with for a specified time. The origin of the custom seems to be coeval with man's first experience of the salutary influence which abstinence exercises on the health, and with his more or less instinctive consciousness of the necessity of retaining the body in due subjection to the soul. By degrees, the self-mortification which it implied raised it into a sacrifice offered to the Deity; it became a religious observance, was surrounded with rites and ceremonies, and finally bore the stamp of a divine law. Climate, the habits of a people, and their creed, gave it at different periods different characteristics; but it may be pronounced to have been a recognized institution with all the more civilized nations, especially those of Asia, throughout all historic times. We find it in high estimation among the ancient Parsees of Irania. It formed a prominent feature in the ceremonies of the mysteries of Mithras; and found its way, together with these, over Armenia, Cappadocia, Pontus, and Asia Minor, to Palestine, and northward to the wilds of Scythia. The ancient Chinese and Hindus, and principally the latter, in accordance with their primeval view—which they held in common with the Parsees—of heaven and hell, salvation and damnation, of the transmigration of the soul, and of the body as the temporary prison of a fallen spirit, carried fasting to an unnatural excess. Although the Vedas attach little importance to the excruciation of the body, yet the Pavaka, by the due observance of which the Hindu believer is purified from all his sins, requires among other things an uninterrupted fast for the space of twelve days. Egypt seems to have had few or no compulsory general fasts; but it is established beyond doubt, that for the initiation into the mysteries of Isis and Osiris, temporary abstinence was rigorously enforced. In Siam, all solemn acts are preceded by a period of fasting, the seasons of the new and full moon being especially consecrated to this rite. In Java, where abstinence from the flesh of oxen is part of the religion of

all, Buddhists and worshipers of Brahma alike, the manner and times of the observance vary according to the religion of the individual. Again, in Thibet, the Dalai-lamaites and Bogdo-lamaites hold this law in common. That Greece observed and gave a high place to occasional fast days—such as the third day of the festival of the Eleusinian mysteries, and that, for instance, those who came to consult the oracle of Trophonius, had to abstain from food for twenty-four hours—is well known. It need hardly be added, that the Romans did not omit so important an element of the festivals and ceremonies which they adopted from their neighbors, though with them the periods of fasting were of less frequent recurrence. See THESMOPHORIA.

As to the Semitic races, although we find the people of Nineveh undergoing occasional fasts, to which even animals were made to conform, yet the Mosaic law set apart one day only in the whole year for the purpose of fasting. The 10th day of the seventh month (Tishri), called "the Day of Atonement" (Yom Kippur), or, as the holiest of the whole year, "the Sabbath of Sabbaths," was ordained for "the chastening of the *Nephesh*," which the traditional law explains as meaning the strictest and most rigorous abstinence from all food or drink, as also from washing, anointing, the putting on of sandals, etc., from the sunset of the ninth to the rising of three stars on the evening of the tenth day. In process of time, five days of compulsory fasting were added, in commemoration of certain days of humiliation and national misfortune—viz., the 17th of the fourth month (Tamus), as the anniversary of the taking of Jerusalem both by Nebuchadnezzar and Titus; the 3d of the seventh month (Tishri), when Ishmael had killed Gedaliah, the Jewish governor appointed by the Babylonians (Jer. xli. 2); the 10th of the tenth month (Tebeth), in remembrance of the siege of Nebuchadnezzar; the 13th of the twelfth month (Adar), the F. of Esther, and the day most rigorously kept, next to the great day of atonement:—the 9th of the fifth month (Ab), the anniversary of the destruction of the first temple by Nebuchadnezzar, and of the second by Titus. That the people had at all times been prone to attach great importance to the use of this penance as a visible sign of outward contrition, is clear from that ordinance of the Mosaic law which puts into the hands of the head of a family the power of confining self imposed vows of abstinence within due limits. The community loved to express their penitence for sin, or their grief on the death of great men, by occasional fastings. They were also considered an efficient means of averting the divine wrath, of insuring victory over an enemy, or of bringing down rain from heaven. Besides, fasting was not unfrequently resorted to by those who wished to free their minds from all hindrances to meditation, as in the forty days of Moses (Exod. xxxiv. 28), or the F. of Daniel (Daniel, x. 2 and 3). This F. of contemplation, as it might be called, seems also to have been the model imitated by the cabalists, some of whom are known to have fasted from Sabbath to Sabbath. In later times, when, after the destruction of the temple, sacrifices had ceased, fasting, as causing a decrease in the flesh and fat of the individual, was considered to be in some degree a substitute for the animal which had formerly been offered up by the priest. From a means to repentance and inward purification, which purpose alone it had been originally intended to serve, it became an end and a virtue in itself; an abuse, indeed, neither unknown nor undenounced even in the days of the prophets. If we add to this the endless chain of dire calamities and ever-renewed persecutions of which the Jews have been the victims for many a long century, the ever-increasing number of their fasts commemorative of deaths and tribulations will be far from surprising. Most of these, however, which were superadded from time to time, soon fell into oblivion. Over and above the six already mentioned, but few entire days are now observed by the orthodox, and these merely of a local character. Fasting, with the Jews, always implies entire abstinence, and lasts, except on the day of atonement and the 9th of Ab—when the sunset of the previous evening is the sign for its commencement—from the break of the day to the appearance of the first three stars. Sackcloth and ashes, the garb of the penitent in ancient times, are no longer worn; but as the special holiness of the day of atonement is celebrated by various solemnities (see FESTIVALS), so the deepest mourning over the loss of temple and country is visibly expressed by many ceremonies in the Jewish synagogues and homes on the 9th of Ab. On that day also, to add the individual to the national sorrow, the cemeteries are generally visited. Of several half-days of fasting that have survived, we will mention the first two Mondays and the first Thursday in the second month (Iyar) and in the eighth month (Cheshwan), (sheni vachamishi vesheni), in celebration of the two meeting-points of summer and winter; as also, several days before the new-year or day of judgment, and before the day of atonement. The individual is bound to celebrate by fasting the anniversary of the death of his parents, his own wedding-day until the performance of the marriage-ceremony, and the birth of his first-born male child (up to its thirteenth year—when the duty falls upon the latter himself), on the day preceding the Pesach (Pasha)—in commemoration of the sparing of the Israelite first-born in Egypt. For the several hours' fasts on the two new-years' days, and on the first six days of the feast of tabernacles, we refer likewise to FESTIVALS, and we will only add in conclusion, that the Sabbath causes the postponement of any F.—that of the day of atonement only excepted—which may happen to be coincident with it; and that children—girls up to their twelfth, boys to their thirteenth year—pregnant women, and the sick, are exempted from the observance.

In the time of Christ, fasting, as we have seen, was held in high estimation. The Mondays and Thursdays—the market-days, on which the judges sat, and the law was read in the synagogues—were especially set aside for this purpose by the Pharisees. The Essenes fasted even more frequently. The Sadducees alone took exception to this rite, and were therefore considered ungodly. Christ himself neither approved nor disapproved of the custom, but, as in all matters of ceremony, allowed his disciples, Jews and Gentiles, to act according or contrary to their old habits. He is distinctly against such a *commandment*, and even excuses those who did not fast. His own abstinence from food for forty days was like that of Moses, entirely an individual act; and against a voluntary and limited imitation of such abstinence, to which the spirit might move a man, no objection whatever was to be taken.* During the first centuries of Christianity, these voluntary fasts were frequent enough; the new converts adhering in most cases to their old rite, and only taking care to change the days, which had been days of abstinence in their former religions, for others. Besides, they were considered a befitting preparation for holy acts and feasts, for ordination and baptism. The time mostly celebrated annually in common by all were the 40 hours from Friday afternoon to Sunday morning, during which time Christ lay in the sepulcher. But not before the end of the 2d c. was anything like an ordinance promulgated with respect to fasting in the new religion. It was first Montanus who, as the Paraclete, introduced, among other laws of excessive severity and rigor, fasting, as an inhibition upon the faithful. The Wednesdays and Fridays as the days when Christ was taken prisoner and crucified, were made days of strictest abstinence from all food; while on the other days of the week, dried, uncooked victuals only were allowed. Asceticism and monachism had their share in the gradual development of the doctrine of the necessity of mortifying the flesh, and as a natural consequence, in the growth and diffusion of the custom of fasting. Yet, in the first six centuries, the difference in the various Christian communities was not greater in any other doctrine or ceremony than in this. Bishops and councils, however, gradually fixed the times and seasons for the whole of Christendom. The 40 hours had gradually become 40 days, called the Quadragesima; and the council of Orleans, in 541, made it binding upon every Christian not to eat any meat during this time, save only on the Sundays.† The eighth council at Toledo, in the 7th c., declared those who ate meat during Lent, sinners unworthy to partake in the resurrection. From the 8th c. to the 11th, when a gradual reaction set in, the laws of fasting and the punishments awarded to the transgressors became stricter and stricter; interdict and excommunication were among the penalties. By degrees they had become so numerous and different in kind, that they were divided into—1. Jejunium generale (a fast binding for all); 2. Consuetudinarium (local fast, etc.); 3. Penitentiale (atonement for all transgressions); 4. Votivum (consequent upon a vow); 5. Voluntare (for the better carrying out of an undertaking). These, again, were kept either as—1. Jejunium naturale (an entire abstinence from food or drink, especially in preparation for the reception of the Eucharist); 2. Abstinentia (certain food only being allowed, but several times a day); 3. Jejunium cum abstinentia (the same food, but which must be taken once a day only); and 4. Jejunium sine abstinentia (all kinds of food, but only once a day). The food prohibited on partial fast-days included, during certain periods, not only the flesh of quadrupeds, fowl, and fish, but also the "lacticinia"—i.e., all that comes from quadruped and bird, as butter, eggs, milk, etc. We cannot here enter into detail; the discrepancies and differences of opinion with respect to the times and modes of fasting, or to the food prohibited, being, even among successive popes and contemporary bishops and elders of the church so numerous, and involved in such obscurities, that the church historians themselves shrink from enumerating them. Suffice it to say, that they gradually developed in the Roman church into—1. Weekly fasts, of which Friday, as the day of the crucifixion, seems to have been early and generally observed. To this was added the Wednesday, as the day on which the death of Christ was resolved upon. These two days received the name of stations; a term borrowed from the *stationes* of the Roman soldiers, in accordance with the views held by the ascetics and monks, that they were

* Roman Catholics, however, maintain that all the words of our Lord, which to Protestants appear to discountenance the obligation of fasting, are directed exclusively against the ostentatious and self-reliant fasts of the Pharisees. They even understand the language which he used in condemning the practice of the Pharisee fasters, as containing a direct exhortation to his own disciples—not that they should abstain from fasting—that they should fast with suitable dispositions. They hold, moreover, that in exempting his disciples from fasting, he had regard only to the actual time of his own presence among them. It was incongruous, he said, that the children of the marriage should fast as long as the bridegroom was with them; but, he added, "the days will come when the bridegroom shall be taken away from them; *and then they shall fast in those days*" (Mark iii. 20; Matt. ix. 15). Hence they infer, that from the time of our Lord's ascension the practice of fasting became obligatory on his disciples, the temporary cause of the exemption hitherto existing having ceased.

† It is only just to add, however, that here again Catholics dissent strongly from the Protestant view of this history. They admit that the followers of Montanus did introduce greater rigor and frequency into their fasts; but they deny that before the time of Montanus the practice of fasting was not fully recognized in the Christian church, and regarded as strictly obligatory. The very earliest allusions to the 40 days' F. of Lent (*tessaracosté*) regard it as an established and recognized institution. The very first fathers who allude to it, speak of it as "handed down and observed by the church;" and so far its origin from being ascribable to the influence of Montanism, that, on the contrary, the earliest relaxations which the church admited were a reaction against the excessive and intolerable rigor of that fanatical sect.

the warriors of Christ. At a synod in Spain in the beginning of the 4th c., the Saturday was superadded, but this innovation met with great opposition, especially in the east, where Jewish notions regarding the Sabbath had obtained a more permanent recognition. 2. Vigils, originally night-services observed by the first Christians on the eve of Sundays and festivals, partly in imitation of the Jewish custom of celebrating the entrance of the Sabbath and of festivals on the evening of the previous day, and partly in fear of the danger to which a service in the day-time would have exposed the early converts. Although these night-services became unnecessary in the course of time, they were still continued up to the 4th c., when, owing to the abuses to which they led, they were abolished, or rather transformed into fast-days, kept on the eve of great festivals in honor of Christ, Mary, saints, and apostles. 3. The great or 40 days' F. (Quadragesimal F.), the most important and most rigorously enforced of all. The 40 hours of F., in commemoration of the 40 hours during which Christ's body lay in the tomb, gradually expanded to 36, or rather 40 days, as mentioned before, in pious allusion to the 40 days of Moses, Elijah, Christ, the 40 years' sojourn in the desert, or the 40 camps —all considered typical—and the fasting became severer the nearer Passion-week itself approached, in which many other signs of mourning and contrition were generally exhibited. 4. The Quatember fasts on the Wednesdays, Fridays, and Saturdays in one week of each season, in imitation of the four Jewish fasts in the 4th, 5th, 7th, and 10th month.—There were still many other fasts, such as those of ordination, etc., but as they had only a temporary existence, we cannot treat of them here Nor can we enter into the various dispensations granted by the church, or the special pastoral letters generally issued before Quadragesima, nor into the variations in the observance of fasts and fasting in our own days; we can only add, that they have in a great measure lost their former severity, and that only partial abstinence is the rule in all cases. The opinion held by the church in former days, that fasting is meritorious, and conducive to the salvation of the soul, has undergone no change.

With respect to the Greek church, we have to observe that fasting was and is kept with much greater severity, the non-observance of it being the least venial of sins. The days here extend over almost three quarters of the year. The principal ones are the Wednesday and Friday—with a few exceptions—throughout the whole year; the great Easter F. lasting 48 days; that of Christmas, 39 days; that in honor of the Virgin, 14 days; and that of the Apostles, beginning on Monday after Trinity, and extending to the 29th of June. Besides those smaller fasts of preparation, which correspond to the vigils of the Roman church, they have many more occasional fasts, which we, however, must omit here.

The church of England considers fasting a praiseworthy, but by no means obligatory custom. According to Hook's *Church Dictionary*, the distinction between the Protestant and the Roman Catholic view of fasting consists in this, that the Roman catholic regards the use of fasting as an imperative means of grace, the Protestant only as a useful exercise preparatory for the means of grace. In proof how much the church of England has left the question of fasting to the conscience and discretion of her members, it may be observed that she has neither defined the mode or degree of fasting, nor anywhere given a positive command to fast. It has been remarked that no bishop of the church of England has in an episcopal charge laid down fasting as a positive requirement. The days named by the English church as seasons of fasting or abstinence, are the forty days of Lent (q.v.), including Ash Wednesday and Good-Friday; the Ember (q.v.) days; the three Rogation (q. v.) days, and all the Fridays in the year (except Christmas-day), and the eves or vigils of certain festivals.

The Scottish almanacs contain lists of the *fast-days* of all the principal places in Scotland. These are generally one in each year, appointed by the kirk-session of the established church of the parish, or by concurrence of kirk-sessions in towns, but generally by use and wont fixed as to their date. The fast-day is always some day of the week preceding the *Communion Sunday*, or Sunday set apart in the Presbyterian churches for the dispensation of the Lord's supper. It is usually appointed as a day for "fasting, humiliation, and prayer." Business is generally suspended, shops shut as on a Sunday, and churches opened for public worship. By an act of parliament passed not many years since, factories are prohibited from carrying on work on the parish fast-day, but in consequence of the ecclesiastical divisions in Scotland, it has become more common than it once was for agricultural and other kinds of work to be carried on. The fast-day of a large town is always a busy day on the railways, many taking advantage of it for excursions, and making it a day of amusement; too many, also, a day of dissipation and revelry. That it is right to keep up the fast-day in these circumstances is doubted by many who themselves conform to its religious observance, although of that observance *fasting* does not now generally form a part. Many, however, doubt if it ever was a good institution; alleging that it is inconsistent with the frequent celebration of the Lord's supper, which they deem right and desirable, and to which there is a growing tendency. The Scottish reformers, as appears from the *First Book of Discipline*, contemplated the ordinary celebration of the Lord's supper at least once a month; and the fast-day, as it now exists in Scotland, derives its origin from a later period.

A few words remain to be said of the Mohammedan fasts. Islam, as an offspring

of Judaism and Christianity, adopted this custom, with many others, from both churches. During the whole month of Ramadan, in which the prophet brought the Koran from heaven, eating, drinking, smoking, smelling perfumes, etc., are strictly forbidden from daybreak till sunset; for the intervening nights, however, all these restrictions are removed. There are, besides, many voluntary fasts, expiatory like the 10th of Moharram, corresponding to the Jewish day of atonement, or for the averting of the Divine wrath in sudden calamities, or as an indemnification for the omission of certain pious acts, as the pilgrimage, etc. See JEWS, MOHAMMEDANISM, MONKS.

Besides the *Bible*, *Schulchan Aruch*, *Koran*, and the fathers generally, we refer to the following authorities on this subject: Bingham, *Orig.*, vol. ix. 1, 21; Fabricius, *Bibliogr. Antiquaria*, c. 11; J. A. Muratori, *De Quatuor Temporum Jejuniis*, etc.; J. Dallœus, *De Jejuniis et Quadragesima*, 1654; Schöne's *Geschichtsforschungen*, Th. 1; *Briefe über d. Gottesd. d. morgenl. Kirche*, von Dr. E. v. Muralt (Leip. 1838); Siegel, *Altchristl. Alterthümer;* Dassel, *De Jure Tempor. Quadrages.*, 1617; Walch, *De Jejunio Quadragesimali* (Jenæ, 1727); Homborg, *De Quadragesima Veterum Christianorum et ritibus in ea quondam usitatis diss. qua etiam de recentior. Papist., Græc., Russ., Syrian., Georgian., Maronit., Jacobit., etc., disseritur* (Helmst., 1677).

Fasting, or deprivation of food, is, in a physiological sense, a state inconsistent with the continuance of life in most warm-blooded animals more than a few weeks. If water is not supplied, the period is much shorter, being in man commonly not more than a very few days, or at most a week. Persons have been found in coal-pits and mines, and in other situations where access to food has been impossible, but where water could be had, as long as six weeks after their seclusion, still alive, though of course in a very feeble condition; and a very small daily allowance of food has supported life longer than this, as in some cases of shipwreck, and other accidents at sea. Cases of alleged fasting, longer than this, as in the notorious woman of Tutbury, are certainly in most instances due to imposture. The insane would appear, in some instances, to bear fasting better than the healthy. Hibernating animals (see HIBERNATION) are capable of sustaining the want of food for an apparently indefinite period of weeks during the winter sleep; but no warm-blooded animal can endure fasting in anything like the same degree as the reptiles, in many of which, indeed, the natural state of existence is one of long intervals between the times of taking food, and in which the vital change of texture is remarkably slow. Thus, the remarkable amphibious animal, the *Proteus anguinus*, has been known to live for years without food, and the same is true of salamanders, tortoises, and even goldfishes. In fasting, the body gradually emaciates, most of the secretions are arrested, or greatly diminished, and at last the animal heat falls rapidly in all parts of the body. In attempting the recovery of persons reduced by fasting, food must be given in very small quantities at a time, and of the most nourishing and digestible quality; stimulants should be either withheld, or very cautiously administered. The most important point, next to the regulation of the food, and sometimes even before food is given at all, is the removal of the torpor and chill of the body by gradually applied heat, with friction of the limbs. See Tiedemann's *Physiology;* Burdach's *Physiology;* Chossat, *Recherches sur l'Inanition.*

FASTEN'S EVE. See SHROVETIDE.

FASTI. *Fas*, in Latin, signifies divine law, and *fastus*, anything in accordance with divine law. Hence the *dies fasti*, or lawful days, among the Romans, were the days on which it was lawful to transact business before the prætor. But the sacred books, in which the lawful days of the year were marked, were themselves denominated *fasti*, and the term was employed, in an extended sense, to signify various kinds of registers, which have been often confounded with each other. These registers fall into two principal divisions—the F. Sacri or Kalendares, and the F. Annales or Historici.

1. *Fasti Kalendares*, or calendars of the year, were kept exclusively by the priests for about four centuries and a half after the building of the city. The appearance of the new moon was proclaimed by a pontifex, who at the same time announced to the people the time which would intervene between the calends and nones. See CALENDS, also CALENDAR. On the nones, the country-people assembled for the purpose of learning from the Rex Sacrorum the various festivals of the month, and the days on which they would fall. In the same way, those who intended to go to law, learned on what days it would be right (*fas*) to do so. The mystery with which this lore was surrounded, for purposes of power and profit, by the favored class, was dispelled by Cn. Flavius, the scribe of Appius Cæcus, who surreptitiously copied from the pontifical book the requisite information, and published it to the people in the forum. From this, time-tables (*fasti*) became common, very much resembling modern almanacs. They contained the days and months of the year, the nones, ides, lawful and unlawful days, etc.; astronomical observations on the rising and setting of the fixed stars, the commencement of the seasons, brief notices concerning the introduction and signification of certain rites, the dedication of temples, the dates of victories, disasters, and the like. In later times, the exploits and honors of the imperial family were duly entered in the calendar. The celebrated *Fasti* of Ovid is a sort of poetical companion to the calendar, as published by Julius Cæsar, who remodeled the Roman year.

Several very curious specimens of F. on stone and marble have been discovered, of

which one of the most remarkable is the Kalendarium Prænestinum, which stood in the lower part of the forum of Præneste, described by Suetonius. Of these ancient F., eleven are enumerated by Foggini, a learned Italian antiquary. One of the most interesting is a rural almanac, known as the Kalendarium Rusticum Farnesianum. It is cut on four sides of a cube, each side of which is divided into three columns, each column embracing a month. The various agricultural operations to be performed in each month are given on this curious relic, in addition to the ordinary information contained in these calendars. In the month of May, for example, the rustic is told that his corn must be weeded, his sheep shorn, his wool washed, etc.

2. *Fasti Annales or Historici* were chronicles, containing the names of the consuls and other magistrates of the year, and an enumeration of the most remarkable events in the history of Rome, noted down opposite the days on which they occurred. From its application to these chronicles, the word F. came to be used by the poets as synonymous with historical records. A very interesting specimen of F. of this class was discovered in the forum at Rome in 1547. The fragments into which it had been broken were collected and arranged by the cardinal Alexander Farnese, and placed in the capitol, where they may still be seen, together with some additional portions which were discovered in 1817 and 1818. See Smith's *Dictionary of Greek and Roman Antiquities, voce* "Fasti," and also the article on "Calendar" (Roman) in the same work.

FAST AND LOOSE is the name of a cheating game, also called *pricking at the belt*, which appears to have been much practiced by the gypsies in the time of Shakespeare. The following is a description: "A leathern belt is made up into a number of intricate folds, and placed edgewise upon a table. One of the folds is made to resemble the middle of a girdle, so that whoever shall thrust a skewer into it would think he held it fast to the table; whereas, when he has so done, the person with whom he plays may take hold of both ends, and draw it away." The game is still practised at fairs, races, and similar meetings under the name of *prick the garter;* the original phrase, "fast and loose," however, is now used to designate the conduct of those numerous slippery characters whose code of ethics does not forbid them to say one thing and do another.

FA'TA MORGA'NA is a striking kind of mirage observed in the strait of Messina. A spectator on the shore sees images of men, houses, ships, etc., sometimes in the water, sometimes in the air, the same object having frequently two images, one inverted. See MIRAGE.

FATE—FATALISM, express a conception which has more or less prevailed in all religions. The words are derived from the Lat. *fatum,* which has primarily a passive signification, denoting something uttered—a decree or ordinance. The Greeks expressed the same thought by *eimarmenê. Moira,* again, was the active personification of the idea—the goddess of fate or destiny. It represented, in the Greek mythology, the final monotheistic element—the vague unity binding together and dominating over the crowd of Olympian deities. In Homer, *Moira* has a double meaning, appearing sometimes as superior to the will of Zeus, and sometimes as inferior to this will. With the course of Grecian thought, the conception of fate became more spiritualized. In Æschylus it is an inexorable destiny; in Sophocles and Plato, it is more of a free and ordering will. In the latter forms of Greco-Roman speculation, again, it undergoes various modifications. With the Epicureans, it seems identical with chance (*tuchê*); with the Stoics, it is the very opposite of this. In the one case, the absolute is a mere blind fatality; in the other case, it is an imminent necessity of reason, governing with iron sway the apparently accidental phenomena of life.

In the two great religions of modern times, Christianity and Mohammedanism, the same conception is found in various forms. In the latter, the highest is conceived as an arbitrary and inexorable law, swallowing up every lower law of activity, and permitting no scope to freedom of development in human nature. In Christianity and the modern speculation which it has colored, it shows itself less broadly in the well-known doctrines of predestination and of philosophical necessity. In the predestination theory of Augustine, Calvin, and many others, the old fatalistic doctrine is repudiated; the recognition of a free determining element in the divine will, separates their idea of it altogether from that of a mere blind destiny; but the influence of the mode of thought out of which the old idea sprung, appears in the manner in which the divine decrees are sometimes spoken of as inexorably overbearing human freedom. In the doctrine of philosophical necessity promulgated by Leibnitz, Edwards, and in a somewhat different form by modern positivism, the same idea emerges under the name of inevitable sequence—of an invariable connection linking together all phenomena material and mental. An immutable law is declared to pervade and harmonize all existence. This is a much higher conception, but it is not difficult to see how easily it may pass into the old pagan doctrine of fate.

The doctrines of predestination and of philosophical necessity have been supposed mutually to support each other; in reality, however, they are very different doctrines. The one starts from the dominating conception of the divine will as overruling all things, and approaches fatalism by ascribing in certain cases such an absorbing energy to this will as to leave no power of free action to any other will. It conceives of everything as swallowed up in the single omnipotence of the divine. It is *pantheistic.* The

other starts from the dominating conception of law in nature, and approaches fatalism by investing this law with an immutable and self-subsistent character. It looks at all existence as a mere undeviating routine of development, and tends in exact opposition to the other doctrine, to shut out the divine behind the screen of the natural. It is *atheistic*. It is, of course, merely the tendency of the respective speculations that is thus characterized.

The conception of fate springs irresistibly from man's consciousness of the transcending greatness of what is outside and above his own feeble existence—of the objective power that incloses and molds his own subjective activity. As such, it will never wholly disappear from human speculation, however endlessly modified it may be.

FATES. See PARCÆ.

FATHER. See PARENT AND CHILD, FAMILY, PATRIA PROTESTAS.

FATHER-LASHER, *Cottus bubalis*, a very common fish on the British coasts, the most spiny of the British species of *cottus* (q.v.), and particularly armed with strong spines on the back of the head—which is large—and on the gill-covers. When touched, it distends its gill-covers, sets out its spines, and assumes a very threatening appearance. Its general aspect is indeed forbidding, and even the little boys who angle from the rocks and pier-heads are usually averse to touch it, although it is said to be wholesome and agreeable food. It is of a brown color above, whitish beneath, curiously marbled and spotted, the fins marbled black and white. In Scotland, it bears the name of *lucky proach*.

FATHERS OF THE CHURCH (*patres ecclesiastici*), certain early writers of the Christian church. The term abba, Græcized ἀββας (father), in use among the Talmudists as a synonym of rabbi (my master), and constituting, according to Maimonides, the third or lowest honorary title of a doctor of the divine law, was in the first centuries of Christianity applied indiscriminately to all theological writers who were distinguished by their learning, genius, or piety. Gradually, however, the word father, or, more fully, father of the church, was confined to those teachers whose writings were considered pre-eminently orthodox, and who might be looked upon as the *progenitors*, as it were, of certain dogmas, upon the development of which they had exercised a more or less direct influence; while those writers who diverged into the fields of heretical opinion were called *scriptores ecclesiastici* (church-writers). Out of the number of the former, some few master-minds, to whom the church owed a still greater tribute, were again singled out as *doctores ecclesiæ* (doctors of the church), which title of pre-eminence, however, is bestowed on many writers who lived subsequently to the time of the fathers, in consideration of their "purer and more excellent doctrine" (Benedict, xiv., *Bulla, Milit. Eccles.*).

The temporal limits within which the fathers are to be confined, as well as their proper share of authority in matters of faith, have long been points of grave discussion. While some include the fathers of the 1st c., generally called the apostolical fathers, on account of their being the contemporaries or disciples of Christ and the apostles, they are excluded by others; again, by some, the 7th c. is made the closing period, while others carry the list down to the 12th, or even the 13th century.

With respect to the authority of the fathers, some, like Fredegis, held their words to be as sacred as those of the prophets and sacred writers; while others, like Alphonso di Castro, Melelius Cano, and cardinal Cajetan, ridiculed the notion that Symmachus should be made equal to St. Paul, or Didymus to St. John the evangelist. Others, again, like pope Gregory and the majority of writers, took the middle course of regarding them not as infallible, much less as prophets and apostles, but held that, when in matters of faith the most perfect and unswerving unanimity reigns among them, then only, the Holy Ghost is to be considered to speak through them. See RULE OF FAITH; INFALLIBILITY.

Immense as is the range and variety of their writings, ascetic, apologetic, polemical, exegetical, moral, historical, or dogmatical, so also is the diversity of their individual value. Nothing can be further from historical justice than either the wholesale laudation or condemnation of these writers as a body; but whatever stand we may take, we cannot but see that they are of the utmost moment. Stretching as they do over the entire extent of that period which forms the turning-point between the antique and modern world, they faithfully and often unconsciously portray that awful change, of which they were in no small degree the instruments—the gradual wane of old faiths, and of an old civilization, and the slow and struggling rise of that which was to replace them; while they preserve the most minute and trifling details with the same accuracy as the most momentous event, as each happened to bear upon their subject. The philosopher, the historian, the antiquary, each and all will find their writings, as a whole, to contain an inexhaustible fund of instruction. Of no less interest, perhaps, are their works in relation to the writers individually. These, issuing from all parts of the then known world, from all ranks, all creeds, could not but impress the stamp of their nationality and callings, besides that of their youth or age, vigor or feebleness, upon their writing—Jew, Greek, Roman, African, Spaniard—orator, poet, lawyer, statesman, priest, they all bring with them that which was their own before they

embraced the new faith: their dialectic power, their fantastic poetry, their graceful speech, their stern austerity. What Greek subtlety did theoretically for the development of dogma in Origen and Athanasius, that Roman thoroughness did practically for the erection of the hierarchy in Leo the great and Gregory III.; while from Egypt came asceticism and monachism, the ascendency of spiritualism over sensualism is owing to those who came from the northern coast of Africa. How far Platonism, and especially Neoplatonism, Aristotle, and Greek philosophy generally, are found developed in these works, and infused into the new faith by the former teachers of the academies themselves, who mostly retained their old philosophical garb, upon this, as well as upon many other points, we must forbear to enlarge.

We will now proceed to take a brief survey of these writers—referring for further information to the special articles on the more eminent among them. According to the now generally adopted method of dating them from the 1st to the 7th c., they are divided into two distinct periods, the first of which goes down to the council of Nicæa, 325 A.D. Of those who head the list, the apostolic fathers—so called from their supposed connection with Christ and the apostles—very little need be said, as their writings, which are mostly of an ascetical character, have come down to us in a corrupt and mutilated state, and as the writers themselves owe their chief celebrity to the times in which they happened to live. We have here Barnabas, the son of Teostes, and the companion of St. Paul (Acts ix. 27; xii. 25); Clement, supposed to have been the third bishop of Rome; and the Clement mentioned by St. Paul (Philipp. iv. 3); Hermas, identical perhaps with the Hermas of St. Paul's Epistle to the Romans (xvi. 14); Ignatius, bishop of Antioch; Polycarp, bishop of Smyrna; Papias; Dionysius the Areopagite, etc. Next follow the apologists, or those fathers whose chief aim was the defense of the new faith against the Roman state, and non-Christian authors, and who were the first to make their scientific culture, and more especially the Platonic philosophy, subservient to Christianity, for this purpose: Quadratus the "evangelist," a traveling missionary; Aristides, an Athenian philosopher; Justin Martyr, the well-known author of the two Apologies and the Dialogue with Trypho (or rather Tarphon); Tatian of Assyria, who, having examined the different forms of worship, as well as the systems of philosophy prevalent in his time, felt satisfied with none but Christianity, and became a disciple of Justin, and a vindicator of the philosophy of the barbarians; Athenagoras, who addressed his apology to the emperor Marcus Aurelius, and his son Commodus, and wrote a Defense of the Doctrine of the Resurrection; Theophilus, bishop of Antioch; Miltiades, etc. Next come the church fathers of Asia Minor, men of more practical and peaceful tendencies: Hegesippus, perhaps an Ebionite; Irenæus, bishop of Lyons and Vienna, who wrote a refutation of the Gnostic system; Hippolytus, his disciple, of unknown birthplace and renowned name. In the North African church, the development of which is of the utmost moment, inasmuch as its language, dogmas, and laws were adopted by the greater part of the Christian world in the west, we find Tertullian of Carthage, the rhetorician and advocate, a man of profound mind and vast influence; Cyprian, the author of the *Testimonies* in favor of Christ; Commodian, the writer of the *Rules of Living;* and Arnobius, a rhetorician of Sicca, in Numidia. The first comparatively barren, though otherwise highly important church, is the Roman. The pre-eminently practical Roman mind looked more to the outward growth and well-being of the church than to literary excellence, and thus we have only two distinguished authors to be noticed here—the presbyter Caius, known as an opponent of the Montanists; and the presbyter Novatian, who wrote a treatise on the Jewish laws respecting food. The church which, more than any other, endeavored to combine speculation with faith, and which gradually became, through its high degree of culture and erudition, the very center of Christianity, is the Alexandrian. And here we have Pantænus; Clement the Alexandrine, chiefly known by his Stromata or Elements of the Gnosis; Origen, called Adamantinus, the eminent Neoplatonist, born 185 A.D., in Alexandria, one of the most influential writers of the whole Christian church; Herculas, with his disciple Dionysius, a liberal and moderate man; Gregory, the worker of miracles; Pamphilus and Julius Africanus, the first Christian chorographer.

In the second period, which dates from the Nicæan council, and comes down to Gregory II., 604 A.D., a period altogether superior, on account of the great number of intellectual and erudite men who devoted their lives and labors to the church, we have to distinguish the Greek from the Latin fathers. Among the former, we have again to draw a line between those of the Alexandrine school—like Eusebius Pamphili, the Heredotus of the church; Athanasius, the father of orthodoxy; Basil the great, doctor ecclesiæ, and his brother Gregory of Nyssa; Gregory of Nazianzen, called the theologian, by way of eminence; Didymus; and Cyrillus, some time patriarch of Alexandria, the chief prosecutor of Nestorius—and those of the Antiochian school, where we find Ephraem Syrus, "the prophet of the Syrians;" Cyril of Jerusalem, the converted Arian; John Chrysostom, of brilliant eloquence; Diodorus, bishop of Tarsus, one of the chief founders of the Antiochian school; and Theodoretus, bishop of Cyrus. Besides these, we find, of Greek fathers who belonged to neither school—Epiphanius, the violent adversary of Origen; Socrates Scholasticus, the continuator of Eusebius's *Ecclesiastical History;* Philostorgius, an Arian church historian; Logomenus; Evagrius; Macarius the elder, chiefly known through his miracles and combats with the devil; Procopius of

Gaza, the rhetorician; and Joannes Scholasticus, famous through his collections of canonical law. Among the Latins, we have to enumerate first the African fathers Fabius Victorinus; Augustine of Tagaste in Numidia, the greatest dogmatist of the western church; pope Gelasius I. (492–96), who finally fixed the canon of the Bible for the Roman church; and the bishops Fulgentius, Junilius, and Facundus. Of Spaniards, we have Prudentius the poet; Paulus Orosius, whom Augustine used as his messenger to the east in his controversies with Pelagius. Of Gauls there are Hilarius Pictaviensis, bishop of Poitiers about 350, the Athanasius of the west; Paulinus of Nola; Sulpitius Severus, friend of Martin of Tours; Vincent of Lerins, once a soldier, who wrote under the name of Peregrinus; Sidonius Apollinaris, bishop of Clermont; Gennadius, the author of an ecclesiastical literary history; Ennodius from Arles, who exerted himself to unite the eastern and the western church; and Gregorius Turonensis, who wrote *Historia Ecclesiastica Francorum*, the basis of Frankish history. From other countries we have Sedulius, an Irishman; Joannes Cassianus, a Scythian; and Mercator, of unknown birthplace. We conclude with the Italians themselves: Lactantius Firmianus, the Christian Cicero; Julius Firmicius Maternus of Sicily; Ambrose, metropolite of Milan, who raised his see to such a power that it dared to resist Rome herself up to the 12th c.; Rufinus of Aquileia, defender of Origen against the charge of heresy brought against him in the west; Eusebius Hieronymus, undoubtedly the most learned of all the Latin fathers, and who mastered also the Greek and Hebrew languages, collected in Palestine the most valuable notes for the elucidation of the Scriptures, and also corrected the Latin edition of the Vulgate; pope Leo I.; Boëthius; Aurelius Cassiodorus, whose *Historia Tripartita*, in twelve books, served for a thousand years as a compendium of ecclesiastical history; the two poets, Arator and Venantius Fortunatus; and pope Gregory I. (509–604), is regarded by Protestants as having first given the western church its peculiarly Roman Catholic stamp by developing the idea of the eucharist into a theophany, and making it the center of the worship. His works, especially his letters, are invaluable for the study of his own times, especially for the history of the conversion of the west.

On the MSS. of the fathers, we refer to *Petri Lambeccii Commentarii de Bibliotheca Cæsareâ Vindobonensi*. The editions of the works of the fathers are of two classes—those of the individual fathers, whose writings are the most voluminous and of highest dogmatical importance, and the general patristic collections, which comprise the writings of the less voluminous or minor fathers. In the former class, the first place, beyond all dispute, belongs to the celebrated Benedictine editions, by the members of the great Maurist congregation of the French Benedictine order (see BENEDICTINES), of which community the task of editing the fathers came to be considered as the recognized work. The Benedictine editions of the greater fathers, with the exception of two or three, still maintain the very highest place in the estimation of the learned. Of the collections of the works of the fathers, the most important are those of La Bigne, Galland, Rössler, Walch, Zimmerman, and Migne. Reference may also be made to cardinal Mai's *Bibliotheca Patrum*, *Spicilegium Romanum*, and *Classici Auctores*, and to the *Spicilegium Solesmense* of the Benedictines of Solesme. Translations of the principal fathers are numerous. The chief works upon the more important fathers are noted under their several names.

FATHIPUR, or FUTTEHPOOR, a district in the Allahabad division of the n.w. provinces of British India, in the s.e. corner of the tract between the Ganges and the Jumna; 1586 sq.m., pop. 72, 663,877, of whom 593,256 were Hindus, 70,554 Mohammedans, and 5 Christians. The district is an alluvial plain formed by the deposits of the two rivers. There are two harvests in a year, the autumn crop consisting principally of rice, and the spring crop of wheat, barley, etc. The East India railway runs through the district.

FATHOM, a measure of six feet, principally used in reference to marine soundings, and in mines. Originally, a fathom was taken as the width to which the two outstretched arms extended.

FA'TIMIDES, or FA'TIMITES, the name of an Arabian dynasty which reigned for nearly two centuries over Egypt. Its founder was Mahadi-Obaidallah, who flourished from 910 to 934 A.D. He asserted that he was descended from Fatima, the daughter of the prophet, and Ismael, a grandson of Ali. He thus won over to his side all the adherents of the widely diffused Ismaelites, an extravagantly schismatic sect of Mohammedans in Africa, and overthrew the race of the Aghlabides, who ruled at Tunis. His successor extended his dominion as far as Fez, and his descendant Moëzz, in the year 970, conquered Egypt, expelled the reigning family, removed his court thither, founded Cairo, assumed the title of caliph, thus proclaiming himself the lawful successor of the prophet, and subdued Syria and Palestine. After the death of Moëzz, the F. maintained their high position for some time; but gradually degenerated, and resigned all the cares of government into the hands of their viziers. Their power now rapidly declined, and their vast territories melted away. In religious matters, the F., because they were raised to power by the followers of Ali, took upon themselves the protection of the Shiite sect, and the establishment of the Ismaelitic doctrines. Between the years 1002–21, the caliph Hakem-Biamr-Allah persecuted the orthodox Mohammedans or Sunnites, as

well as Jews and Christians. He founded an academy at Cairo, and endowed it largely, but connected with it a secret society for the diffusion of Ismaelitic opinions. In the first stages, the novice was shown the untenable nature of the precepts of the Koran; in the sixth, the advanced student found that religious legislation must give way to the claims of philosophy; in the seventh, a mystic pantheism was proved to be the true philosophy; and finally, in the ninth, the initiated discovered that he was not required to believe anything, and might do whatever he pleased. His system, with considerable modifications, found a home among that peculiar people the Druses (q.v.). After the death of Adhid, the last of the F., in 1171, the founder of the dynasty of the Ayubides, Salâh-ed-dîn (Saladin), took possession of Egypt.

FAT LUTE is the term applied to a composition of linseed-oil and pipe-clay. See LUTE.

FATS are those oily substances which are solid at ordinary temperature. They do not differ essentially from the liquid oils. See OILS.

FATS, ANIMAL. There is considerable difference of opinion amongst chemists regarding the exact nature of the fats occurring in the animal body. According to most chemists, they are composed of an admixture of three separate fats—margarine, stearine, and oleine, of which the two former are solid, and the latter fluid, at ordinary temperatures. Heintz, who has carefully studied these bodies, declares, however, that margarine is not a simple fat, but a mixture of stearine and palmitine (a solid fat occurring in palm-oil); and he considers human fat to be a mixture of stearine, palmitine, and oleine. For the chemical characters of these substances, we refer to the articles MARGARINE, OLEINE, PALMITINE, and STEARIC ACID, and we proceed to the consideration of the physiological relations of the fat.

Fat, usually inclosed in vesicles, is found very extensively in the animal kingdom. It is abundant in many larvæ, and occurs more scantily in most insects. It is met with in the mollusca, and is comparatively abundant in all the divisions of the vertebrata. In most fish, it occurs throughout the body, but is especially abundant in the liver, where it is found in the hepatic cells, and not in its own characteristic vesicles. In reptiles, it chiefly exists in the abdomen. In birds, we especially find it about the peritoneum, and under the skin. In mammals, it is very generally diffused, but the greatest quantity is under the skin, in the omentum, and round the kidneys.

The quantity of fat in the human body varies considerably at different periods of life. In the earlier stages of fetal existence, we find scarcely any fat; in new-born children, there is usually a considerable quantity of this substance deposited under the skin, and the organism continues rich in fat till the age of puberty, when a marked diminution of the substance occurs. It again increases about middle life, and then occasionally occurs in great excess; for example, 3 or 4 in. of fat are not unfrequently found under the skin of the abdomen in corpulent persons.

Extraordinary deposits of fat in some particular part of the body are observed in certain races of men and animals. One of the most remarkable examples of this peculiarity is afforded by the Hottentot women, in whom the fat accumulates in the gluteal region to such an extent as to give a most remarkable prominence to that part of the body; and a somewhat analogous deposit exists in a variety of sheep (*ovis steatopyga*, the fat-buttocked sheep), in which a large mass of fat, sometimes attaining a weight of 40 lbs., is developed on the buttocks, and takes the place of a tail.

The origin of the fat in the animal body must undoubtedly be chiefly referred to the fat taken with the food. It has, however, been proved by the most careful investigations on various animals submitted to the process of fattening, on bees fed with cane-sugar, or with honey containing scarcely any wax, and on the larvæ of the insects inhabiting galls, that the animal, like the vegetable organism, has the power of forming or producing fat, far more fat being found, in these experiments, in the body of the animal, than could be referred to the fat taken in the food. The excess must therefore have been formed either from the non-nitrogenous portion of the food, such as starch and sugar; or from the nitrogenous matters, such as fibrin, albumen, etc. In the case of the bees, it was distinctly proved that the fat was formed from sugar; while in the case of the larvæ of the gall-insect, it was similarly shown that it was produced from the starch which forms the interior of the gall in which the animal lives; and as we have no corresponding evidence of the convertibility of fibrin, albumen, etc., into fat (although such a conversion is by no means improbable), we must for the present regard the non-nitrogenous foods as the chief fat-formers next to fat itself.

The physiological value of the fats is partly due to their physical, and partly to their chemical characters.

The uses of the fat deposited beneath the skin are, first, to protect the body from external shocks by a uniform diffusion of pressure through the whole adipose tissue; and, second, to keep up the heat of the body, by materially checking, through its very slight conducting power, the loss of free heat by radiation. This use of the fat is most clearly seen in some of the lower animals (the seal, whale, etc.), which are exposed to very low temperatures.

Another physical use of fat is to promote the mobility of various organs. Hence, in

cases of extreme emaciation, it always remains in the parts where motion is most essential, as the heart, and the orbit of the eye.

Another of its important physical properties is that of rendering other bodies supple, and diminishing their brittleness. In this point of view, the use of fat is very conspicuous in the bones.

The chief chemical use of the fat is its power of exciting and supporting the animal heat. In the oxidation of the fats in the animal organism, whether the process be gradual or rapid, a large amount of heat must necessarily be liberated; and that they are oxidized, and for the most part reduced to carbonic acid and water, is evident, because they neither appear in any quantity in the excretions, nor, as a general rule, accumulate beyond a certain point in the organism. An accumulation of fat thus serves as a reservoir of combustible matter in time of need. This is especially evident in the case of hybernating mammals, as, for example, hedgehogs, in which an enormous quantity is deposited just before the hybernating period: during this period, it gradually disappears, its carbon being slowly consumed in the respiratory process, and keeping up the animal heat.

Fat is, moreover, one of the most active agents in the metamorphosis of animal matter. Lehmann ascertained that a certain, although a small quantity of fat was indispensable to the complete gastric digestion of nitrogenous food, a fact which is confirmed by the observation that in experiments on artificial digestion, the solution of substances used as food is considerably accelerated by the presence of a little fat. The occurrence of fat in the milk and in the egg, as also in all highly cellular organs (as, for example, the liver), is a clear indication that this substance plays an important part in the process of cell-formation; and no animal cell or cell-yielding plasma has ever been observed in which fat is not a constituent.

An undue accumulation or increased growth of the fatty tissue gives rise to the condition known as obesity (q.v.).

FATTY ACIDS. See OILS.

FATTY DEGENERATION, a pathological term signifying the gradual replacement by fat-globules of the tissues of a living body, impairing and finally destroying them. These globules, though originating in the living tissues and existing among them, have in themselves no element of life; hence when they replace living tissues they are destructive of them. Fatty degeneration must be distinguished from obesity, which is simply excessive deposition of fat between the tissues. The disease, which is not regarded as curable, is of frequent occurrence, and it attacks nearly all the tissues, particularly the muscular and cellular, as in the heart and liver, which organs are often the seats of the disease. The red blood globules and the nerves are probably never attacked by it.

FATUITY, or DEMENTIA, consists in the impairment or extinction of certain mental powers, or of all. Esquirol has quaintly but descriptively said that the idiot and imbecile are poor who have never been rich, but that the fatuous or dements are rich who have been made poor. This impoverishment is sometimes so extreme, and the sufferer is so little influenced by consciousness as to lose a knowledge of his own existence; and so little by impressions through the external senses, and by the instincts of the sensory ganglia, as to be equally ignorant of the existence of others. Life is vegetative merely. This deprivation may be partial or complete. It may appear as a weakening of sensibility. This is not the tolerance of powerful or painful impressions, or indifference to such, springing from abstraction or engrossment of the attention, but positive extinction of perception; or it may present the more common form of enfeeblement of intelligence, of memory; of the will, where the patient is apathetic, passive, plastic. The disease may involve the affections and the moral sense, and abrogate the power of decision, and all spontaneity of action and thought. Incoherence in ideas and words may be made to constitute another form, although generally regarded as a characteristic; whether it amounts merely to forgetfulness, or to confusion or irrationality, to inconsecutiveness and inability to express instincts and wishes. Delusions and hallucinations may co-exist with these conditions, but like the real impressions received by this class of the insane, they are feeble, fugacious, and uninfluential. Under all these aspects, the essential element is privation of power; and this is met with as a specific mental disease, arising from obvious causes, unassociated with general alienation, acute in its nature, and rapid in its progress. It is most frequently the disease of youth, of the period of puberty, contemporaneous with growth, with debilitating and exhaustive processes, and depending, in all probability, as in the other forms, upon insufficient nutrition of the brain. At this age, the injury is reparable, and what may be designated juvenile dementia, has the rare distinction of being curable. More frequently, it is the sequel of mania, melancholia, and severe affections of the nervous system. The deterioration here arises from actual changes in the nervous structure, which render healthy nutrition impossible; so that, although mitigation, and sometimes to a marvelous extent, is within reach of treatment, recovery is believed to be impracticable. Again, it is an affection of old age; and although senile dementia may seem but an exaggerated state of dotage, it is accompanied by such marked physical changes, as to leave no doubt that it originates in circumstances differing widely from that gradual degeneration of the

tissues which is evidenced by the "second childishness and mere oblivion." Lastly, this state may follow fever, when it is transitory, and generally of brief duration.

F. is one of the few morbid mental conditions recognized in our legal code, even by name, as relieving from the consequences of criminal acts, and as disqualifying for the administration and disposal of property. Esquirol, *Des Malad. Ment.*, tom. ii. p. 219.

FAUCHER, Leon, a French publicist and statesman, was b. at Limoges, 8th Sept., 1803; studied at first philology and archæology, in which branches of knowledge he acquired some reputation; but about the period of the July revolution (1830), betook himself, with genuine enthusiasm, to journalism and political economy. He became successively editor of the *Temps*, *Constitutionnel*, and the *Courrier Français*. These functions occupied him from 1830 to 1842, during which period he published many articles on questions of political economy. In 1843, he began to write for the *Revue des Deux Mondes* a series of articles on the industrial condition of England. The whole were collected into two volumes, which appeared in 1845, under the title of *Etudes sur l'Angleterre*, and constitute the most weighty and substantial of all his productions, though Englishmen reckon the author greatly in error in many points. At the general elections of 1846, he was elected for the manufacturing city of Rheims, where his opinions on tariffs were highly appreciated. In the chamber of deputies, he voted with the dynastic opposition. A ready but by no means brilliant speaker, he came forward as one of the leading advocates of free trade, and published in the *Siècle*, and in the *Revue des Deux Mondes*, a number of essays on national economy, characterized by their vigorous and spirited argumentation. After the revolution of 1848, he sat both in the constituent and legislative assemblies for the department of Maine. When Louis Napoleon was chosen president, F. became first minister of public works, and subsequently minister of the interior; but when the president proposed to appeal to universal suffrage, F. gave in his resignation, and after the *coup d'état*, he withdrew from political life. F. died 14th Dec., 1854. A large number of his most valuable contributions to the science of politics will be found in the collection of the *Economistes et Publicistes Contemporains*, and in the *Bibliothèque des Sciences Morales et Politiques*.

FAULK, a new co. in central Dakota, 1000 sq.m.; organized since the census of 1870. It is mainly a table-land, drained by a branch of the Dakota river.

FAULKNER, a co. in n. Arkansas, on the Arkansas river, reached by the Little Rock and Fort Smith railroad; 650 sq.m.; formed since the census of 1870. Co. seat, Conway.

FAULKNER'S ISLAND, in Long island sound; off the harbor of Guilford, Conn. It belongs to New York, and has a light-house and a fog-bell.

FAULT, the term in mining and geology for any interruption in the continuity of the strata, coupled with the displacement of the beds on either side of the line of fracture. See Dislocation.

FAUN. Faunus was a mythical personage, an ancient king of Italy, who instructed his subjects in agriculture and the management of flocks, and was afterwards worshiped as the god of fields and of shepherds. The festival of the *faunalia*, held on the 5th Dec., referred to the protection he exercised over agriculture and cattle. Fauna was his female complement. He was also worshiped as a prophetic divinity. As deity of the woods and of flocks and herds, he corresponds to the Greek Pan. the idea also arose of a plurality of fauni or fauns, like the Greek satyrs, who were represented as monster deities with short horns, pointed ears, tails, and goats' feet, and to whom all terrifying sounds and appearances were ascribed.

FAUNA, a term employed to designate animals collectively, or those of a particular country, or of a particular geological period. Thus, we speak of the fauna of Great Britain, the recent fauna, the fossil fauna, the fossil of the eocene period or formation, etc. The term bears the same relation to the animal kingdom that *flora* does to the vegetable. Its derivation is from the mythological fauns, regarded as the patrons of wild animals. In the fauna of any country are included only those animals which are indigenous to it, and not those which have been introduced.

FAUQUIER, a co. in n.e. Virginia, between the Rappahannock and the Blue Ridge, intersected by the Virginia Midland and Great Southern railroad, and by the Manassas branch of that railroad; 680 sq.m.; pop. '70, 19,690—7,856 colored. Surface undulating, and to a large extent covered with forests. Productions, corn, wheat, oats, pork, etc. Co. seat, Warrenton.

FAUQUIER, Francis, d. 1768; for 10 years lieutenant-governor of Virginia. He was the successor of gov. Dinwiddie, and his administration was popular and prosperous. He published in London in 1757 *Raising Money for the Support of the War.*

FAURE, Jean Baptiste, b. 1830; a French vocalist, educated at the conservatoire, and made his first public appearance in 1852. In 1857, he was made professor of singing in the conservatoire. He has often appeared in opera in London.

FAURIEL, Claude Charles, a French philologist, historian, and critic, was b. at St. Etienne, in the department of Loire, 21st Oct., 1772, studied at the college des Oratoriens at Tournon, and afterwards at Lyon, and in 1799 was appointed to a situation

under Fouché; but, destitute of all political ambition or predilections, and passionately fond of learned studies, F. resigned his office in 1802, and devoted himself to the calmer pursuits of literature. He made himself familiar with Sanscrit, Arabic, and the treasures of classical antiquity and of the middle ages; and although he did not write much, comparatively speaking, yet the value of what he did write cannot be easily over-estimated. M. Renan may exaggerate when he affirms that F. "put in circulation the greatest number of ideas" of any contemporary writer; but even the Germans allow that in many points of literary history, criticism, and philology, F. was 20 years in advance of his age. After the July revolution, he was appointed a professor at the Sorbonne; in 1836, he published his chief work, *Histoire de la Gaule Méridionale sous la Domination des Conquérants Germains* (4 vols., Paris), which is reckoned one of the best specimens of historical investigation and art produced in modern times. Worthy of notice, also, particularly on account of its remarkable historical introduction, is his edition of the Provençal rhymed chronicle, entitled *Histoire de la Croisade contre les Hérétiques Albigeois* (Paris, 1837). F. also contributed several important essays to the literary journals of France, of which, perhaps, the best known was that on the origin of the Epic of Chivalry in the middle ages. He died at Paris, 15th July, 1844. Two years after his death appeared a collection of his professorial lectures, under the title of *Histoire de la Poésie Provençale* (3 vols., Paris, 1846), in which F. endeavors, with great erudition and originality of criticism, to show that to the Provençals must be attributed the composition and primitive development of the greater portion of the romances of chivalry, including those which describe the contests of the Christians and Moors in Spain, and those which form the Charlemagne cycle, thus finding the origin of the old Spanish and German poetry on the soil of France. F.'s views have, however, met with considerable opposition.

FAUSSE-BRAYE, in fortification, a low rampart encircling the body of a place, and raised about 3 ft. above the level ground. This work has been mostly discarded by modern engineers, except when used in front of curtains, under the name of *tenailles* (q.v.). The French engineers gave this title to the work, as an adaptation from the Italian term *fossa brea*, which had its origin from the fausse-braye being commonly in the ditch, in front of the main wall. The fausse-braye had the advantage of giving an additional tier of guns for defensive purposes; but the still greater disadvantage of affording facilities for the scaling of the parapet.

FAUSSE RIVIÈRE (in English, *False river*), is a lake of Louisiana, United States, which deserves notice chiefly as an index of the physical character of the country. Till about a century and a half ago, it was a channel of the Mississippi—a fact which is still probably expressed in its name. Here, as in other alluvial formations, the beds of the running waters are undergoing incessant changes.

FAUST, or **FUST**, JOHANN, the chief promoter of the invention of printing, a rich citizen of Mayence, d. in the year 1460. See GUTENBERG.

FAUST, DR., according to tradition, a celebrated dealer in the black art, frequently confounded with the preceding, was b. at Knittlingen, in Würtemberg, or, as some say, at Roda near Weimar. He flourished during the latter half of the 15th and the beginning of the 16th centuries, and is said to have studied magic at Cracow. After having spent a rich inheritance left him by his uncle, F. is alleged to have made use of his "power" to raise or conjure up the devil, with whom he entered into a contract for twenty-four years, obtaining during that time his fill of earthly pleasure, but at its termination surrendering body and soul into the hands of the great enemy. The devil gave him an attendant spirit or demon, called Mephistopheles, though other names are given him by the later traditionists, with whom he traveled about, enjoying life in all its forms, and astonishing persons by working wonders, till he was finally carried off by the evil one, who appeared in terrible guise, between twelve and one o'clock at night, at the village of Rimlich, near Wittenberg, though several other places lay claim to that very questionable honor. Some have doubted, considering the monstrously mythical form in which his career has come down to us, whether such an individual as F. ever existed; but it is now generally believed that there was a basis of fact, on which tradition has built its gross superstructure. Gorres, indeed, asserts that one George Sabellicus, who disappeared about the year 1517, is the real F.; but Philip Melanchthon —the man of all the reformers whose word in regard to a matter of fact would most readily be trusted—says that he had himself conversed with Dr. Faustus. Conrad Gesner (1561) is equally positive; and Luther, in his *Table Talk*, speaks of Dr. F. as a man lost beyond all hope. The opinion that prevails, and which is reckoned to be intrinsically the more probable, is that some man of this name, possessed of varied knowledge, may possibly have practiced jugglery (for the wandering savants of the middle ages had all a touch of the quack about them), and thus have been taken by the ignorant people for a dealer in the black art, and one who maintained a secret and intimate relation with evil spirits. His widely diffused celebrity not only occasioned the wonders worked by other so-called necromancers of an earlier age—Albertus Magnus, Simon Magus, and Paracelsus—to be attributed to him, but likewise many ancient tales and legends of a marvelous character were gradually transferred to him, till he finally appears as the very hero of magicians. But while, on the one hand, the narra-

tive of F.'s marvels afforded amusement to the people, on the other, they were made use of for instruction by the clergy, who pointed out, in the frightful fate of F., the danger of tampering with the "black art;" and the abominableness of a life sunk in sensuality and vice. The myth of F. has received a manifold literary treatment. First come the *Volksbücher* (or people's books), which record F.'s enterprises and feats. The oldest of these now known appeared at Frankfort in 1588. Then came an "improved" edition of the same, by Widmann, entitled *Wahrhaftige Historien von denen gräulichen Sünden Dr. Joh. F.'s* (true history of the horrible crimes of Dr. John F., Hamb. 3 vols., 1599); and in 1695, a work was published at Nürnberg by Pfitzer, based upon that of Widmann. The oldest of these books was translated into all the civilized languages of Europe. Impostors also published books of magic under the name of F., such as *Faust's grosser und gewaltiger Höllenzwang* (Faust's Great and Potent Book of Spells), *Fausten's Miraculkunst* (Faust's Art of Performing Miracles), and *Dreifache Höllenzwang* (The Threefold Book of Spells). These wretched productions are filled throughout with meaningless scrawls and figures, interspersed with texts from the Bible scandalously misapplied; but in the belief of the vulgar, they were supposed capable, when properly understood, of accomplishing prodigies. That the poetical art should in due time have seized on a subject affording so much material for the fancy to work upon, was inevitable; and consequently, German literature abounds in elegies, pantomimes, tragedies, and comedies on Faust. Since the end of the 17th c., the *Puppenspiel* (Puppet-show) of Dr. F. (first published at Leipsic in 1850) has been one of the most popular pieces in Germany. It forms the transition from the rude magic tales concerning F., to the later philosophic conception of the Faust-myth, which has become the most perfect poetical expression of the eternal strife between good and evil in the soul of man. The first writer who treated the story of F. dramatically was the English writer Christopher Marlowe, about the year 1600 (German translation by W. Müller, Berlin, 1818); but the grandest work on the subject is Goethe's *Faust*, the first part of which appeared under the title of *Dr. F. ein Trauerspiel* (Leip. 1790), and afterwards in a remodeled form, under the title of *F., eine Tragödie* (Tübingen, 1808). The second part was published after the author's death, at Stuttgart in 1833. Besides Goethe's drama, may be mentioned Eessing's masterly fragment, *F. und die Sieben Geister* (F. and the Seven Spirits), G. F. L. Müller's *Dr. F.'s Leben* (Dr. F.'s Life, Manh., 1778), and Klinger's *F.'s Leben, Thaten, und Höllenfahrt* (F.'s Life, Doings, and Descent Into Hell; Petersb. and Leip., 1791). The plastic art has also found a fit subject in Faust. In Auerbach's cellar at Leipsic, where F. is said to have performed many of his feats, are two rude daubs of the year 1525, representing F. and Mephistopheles riding out of the cellar on a wine-barrel. Rembrandt and Christoph von Sichem have also illustrated the story of F., and, in modern times, Cornelius and Retzsch have done the same. See Peter's *Die Literatur der Faustsage* (3d ed. 1857); Engel's *Das Volksschauspiel Dr. F.* (1873).

FAUSTI'NA, mother and daughter. The former, *Annia Galeria*, usually spoken of as *Faustina Senior*, was the wife of the Roman emperor Antoninus Pius, and died 141 A.D.; the latter, known as *Faustina Junior*, was married to his successor, Marcus Aurelius Antoninus, and died at a village near Mt. Taurus in 175 A.D. Both, but particularly the younger, were notorious for the profligacy of their lives, which their exemplary husbands in vain endeavored to check. After their deaths, institutions for the relief of poor girls were founded both by Antoninus and Marcus Aurelius in honor of them, and were called "*puellæ alimentariæ Faustinæ.*" Marcus Aurelius, in his Meditations, speaks highly of his wife, and an attempt has been made by Wieland to defend her against the imputations of the historians of the emperors.

FAUSTI'NUS I., Emperor of Hayti, known, before his elevation to the throne, as Faustinus Soulouque, a negro originally of very humble circumstances, was b. in St. Domingo in 1789. In his earlier years, he acted as servant, and afterwards as adjutant, to gen. Lamarre. He subsequently served under presidents Petion and Boyer, and by the latter was raised to the rank of capt. After the year 1844, when the Haytian republic—of which gen. Boyer was then president—was dissolved, a struggle for the supreme power ensued, in which F. played an important part. In 1847, he was appointed by the senate president of the republic. On the 16th April, 1848, a dreadful massacre of the mulattoes in Port-au-Prince took place at his instigation. This, and similar measures, struck terror into the hearts of his opponents. In Aug., 1849, he had himself proclaimed emperor of Hayti, a title which he enjoyed for about ten years; but a revolution having broken out in 1858, and a republic having been declared, F. was forced to abdicate, 15th Jan., 1859. He died 6th Aug., 1867.

FAUVEAU, FÉLICIE DE, b. Florence, 1803; a French sculptor of an old legitimist family in Brittany. She was compromised in the royalist movement of 1832, but escaped to Brussels. Among her works are "The Abbot" (from Scott's novel); "Judith showing the Head of Holophernes to the People;" the Dante monument, representing the death of Paolo Malatesta and Francesca da Rimini; and the tomb of a young Florentine girl.

FAUVELET, JEAN BAPTISTE, b. France, 1822; a painter, disciple of Meissonnier. Among his pictures are: "A Young Man Reading," "The Two Roses," "The Concert," "Nonchalance," "The Carver," "Two Musicians," and "The Prodigal Son."

FAUVETTE, a French name, partially adopted in the English language, for some of the little song-birds of the family *sylviadæ* or warblers, having straight slender bills slightly compressed in front, the ridge of the upper mandible curving a little towards the tip, and the legs not long. They mostly belong to the genus *curruca*, as the blackcap, the pettychaps or garden warbler, the whitethroat, etc.; and to the genus *salicaria*, as the sedge warbler, the reed warbler, etc. The Dartford warbler (*melizophilus provincialis*) is also called fauvette. They are all very lively little birds, continually flitting about in pursuit of insects, most frequently bushy places; and some of them, particularly those of the genus *salicaria*, preferring watery situations where reeds abound.

FAVA'RA, a t. of Sicily, in the s. of the island, in the province of Girgenti, and 4 m. s.e. of the town of that name. It has rich sulphur-mines. Pop. in 1871, 15,233.

FAVART, CHARLES SIMON, a French dramatist, was b. at Paris, 13th Nov., 1710, and first became known by his *La Chercheuse d'Esprit*, performed in 1741. In 1745, he married Mdlle. Duronceray, herself a dramatic writer of some note, and a singer of remarkable talent, and in the same year became director of the *Opéra Comique*. The fine taste and judgment of F. and his wife soon obtained for their theater a great reputation. It was they who made the first attempt to harmonize the costume of the actors and actresses with their impersonations, and to put a stop to the ridiculous practice of decking out soubrettes and country-girls in the attire of court ladies. So powerful, however, was the opposition excited against them by the jealousy of the other theaters, that the *Opéra Comique* was closed in the first year of its existence. After some time spent with maréchal de Saxe during his campaign in Flanders, F. and his wife returned to Paris, where the former continued to write operas. His wife died in 1772, and he 12th May, 1793. F.'s success as a writer was very great: he may be reckoned the father of the comic opera, and the happy successor of Le Sage, Piron, etc. The number of his pieces amounts to about 60, of which the most celebrated are *Comment l'Esprit vient aux Filles; Le Coq du Village; Bastien et Bastienne; Ninnette à la Cour; Les Trois Sultanes;* and *L'Anglais à Bordeaux*. His works have been published several times. An edition in 10 vols. was published at Paris in 1810, under the title of *Théâtre de Monsieur et Madame Favart*. A very interesting book, entitled *Les Mémoires et la Correspondance de Favart*, giving delightful glimpses of the literary and theatrical world of the 18th c., was published at Paris in 1809 by his grandson.

FAVERSHAM, a municipal borough and seaport in the n. of Kent, on a navigable creek, opposite Sheppey isle, 8 m. w.n.w. of Canterbury. It chiefly consists of four streets in an irregular cross. It has a valuable oyster-fishery, employing 200 to 300 persons. It sends much agricultural produce to London by hoys. The creek admits vessels of 150 tons. In the vicinity are some of the most important gunpowder factories in the kingdom. Pop. '71, 7,198. Under the name of Favresfield, it was a seat of the Saxon kings, where Athelstan, in 930, held a Witenagemôte. It has the remains of an abbey founded by king Stephen, where he and his queen, Matilda, are buried. St. Crispin is said to have been apprenticed to a shoemaker here. Near F. are some chalk caverns, with columns. In 1876, 8,861 vessels, of 399,837 tons, entered and cleared the port.

FAVIGNA'NA, the chief of the Ægades, a group of islands in the Mediterranean, off the w. coast of Sicily, lies at a distance of 6 m. from the Sicilian shore, and is about 6 m. long, with an average breadth of 2 miles. It has a town of the same name, with two castles, and a population of ('71) 4,642. F. is fruitful, has good pasturage, and produces excellent wine.

FAVONIA, a genus of jelly-fishes of the order *discophora*. One species has a hemispherical body, with a long proboscis and eight branch-like appendages.

FAVORI'NUS, a sophist of the time of Hadrian, a native of Arles, in Gaul, but for many years a traveler in the east. He was on intimate terms with Plutarch, Herodes Atticus, Demetrius of Alexandria, Aulus Gellius, and with the emperor Hadrian himself. He seems to have been caustic and satirical, but politic; for when he allowed the emperor to carry off the honors of an argument in which he might easily have won, he merely remarked that it was foolish to dispute with one who was master of thirty legions. Only a few fragments of his works have been preserved.

FAVORS, or MARRIAGE FAVORS, bows of white satin ribbons distributed at marriages in Great Britain, and usually pinned on the breast of all concerned, attendants and postilions included. The F. of those more immediately interested are sometimes enriched with orange-blossom. This is an old usage, connected with the love-knot of ancient northern nations; it forms almost the only remaining token of merriment in the nuptial ceremonial, and is, indeed, itself beginning to disappear.—See Brand's *Popular Antiquities*, edited by Ellis, article "Bride Favors."

FA'VOSITES, a genus of lamelliferous corals, found in Silurian, Devonian, and carboniferous strata. They were social corals, closely packed together, no space being left between the walls of the different corallites. As in the other paleozoic corals, the lamellæ are developed in multiples of four, and the older portion of the stony base is partitioned off by horizontal tabulæ.

FAVRE, JULES CLAUDE GABRIEL, a French advocate and minister, was b. at Lyons, 21st Mar., 1809. He is the son of a merchant, studied for the bar, and passed at Lyons in 1830. His political opinions have always been intensely republican, and when pleading in the course of numerous political lawsuits, F. not unfrequently placed the state solicitors, and even the judges, in a very embarrassing position by the boldness of his sentiments. As the defender of the *Mutuellists* at Lyons, in 1831, he was in danger of losing his life; this, however, did not prevent him from defending those who had been impeached in April, and commencing his speech with *Je suis républicain*. Since 1834, F. has been a member of the Paris bar. In the Feb. revolution of 1848, he was home secretary, in which capacity he wrote the notorious circular for which Ledru-Rollin's administration was so severely reproached, investing the commissioners of the republic with dictatorial authority in the provinces. He was active as a member of the committee of foreign affairs. After the election of the 10th Dec., F. showed himself a persistent antagonist of Louis Napoleon, and after the flight of Ledru-Rollin, became the orator of the mountain. The *coup d'état* closed his political career at this time. He refused to take the oath of fidelity to the imperial government, and betook himself again to his profession. In 1858, he defended Orsini on his trial for a conspiracy to murder. In the same year, however, he became a member of the legislature. In Sept., 1870, after the downfall of the empire, he was appointed minister of war, and carried on negotiations with count Bismarck. He resigned office in July, 1871, and resumed practice at the bar. F. is greatest in political repartee, and, though long accustomed to public strife, his language is noted for its Attic elegance.

FAVULA'RIA, a sub-genus of *sigillaria*, including some of the most remarkable trees of the coal flora. See SIGILLARIA.

FA'VUS (Lat. a honeycomb), a disease of the skin, chiefly of the hairy scalp, characterized by yellowish dry incrustations of more or less roundish form, and often cup-shaped, composed of the sporules and mycelia (q.v.) of a vegetable growth belonging to the order of fungi (q.v.). The disks of F. are produced with great rapidity, and spread rapidly, if not attended to at the first, over the whole scalp, destroying the bulbs of the hair, which becomes very short and thin, and then falls out altogether. F. is a disgusting and unsightly, but hardly a dangerous disorder; it is, beyond doubt, contagious, but only spreads where cleanliness is greatly neglected, and is therefore almost unknown among the better classes. It is far more common among children than among adults, and seems to be more frequent in Scotland than in England, and more frequent also on the continent than in either England or Scotland. The cure is sometimes attempted by a variety of medicated and simple ointments, and by pulling out the hair by the roots, or *epilation*, as it is called; but it seems hardly possible in inveterate cases to get rid of the disease without a very long persistence in habits of the most scrupulous cleanliness, and therefore the cure is seldom permanent, though easily attained for the time. F. is almost always followed by permanent baldness of the parts affected; unlike ringworm (q.v.), which is a minor disease of the same order.

The F. fungus, *achorion schœnleinii*, is nearly allied to the fungus which has recently proved so destructive to vines, and has by some botanists been placed in the same genus, *oidium*.

FAWCETT, HENRY, b. England, 1833; educated at Trinity hall, Cambridge, of which he was a scholar; graduated with high mathematical honors in 1856, and was elected a fellow in the same year. Mr. Fawcett was totally deprived of his sight in 1858 by an accident when shooting. Having written and published *A Manual of Political Economy;* the *Economical Position of the British Laborer;* and having been an extensive contributor of articles on economic and political science to various magazines and reviews, he was elected, in 1863, professor of political economy in the university of Cambridge. He unsuccessfully contested for a parliamentary seat, on liberal principles, Southwark in 1857; the borough of Cambridge in 1862; and Brighton in Feb., 1864; but he was returned for the last-named constituency in 1865, and was re-elected in 1868. He was unseated at Brighton at the general election of Feb., 1874, and was elected for Hackney in April of the same year. A new and revised edition of his *Manual of Political Economy* was published in 1869, with two new chapters on "National Education," and "The Poor Laws and their Influence on Pauperism;" and another edition with some additional chapters was published in 1874. He has since published *Pauperism—Its Causes and Remedies; Speeches on some Current Political Questions;* and *Free Trade and Protection.* Prof. F. married Millicent, daughter of Newson Garrett, of Aldeburgh, Suffolk, April 23, 1867. Mrs. Fawcett, who was born in 1847, published, in 1869, *Political Economy for Beginners;* in 1872, Mr. and Mrs. Fawcett published a joint volume of essays and lectures on political and economical subjects; in 1874, Mrs. Fawcett took an active part in advocating the extension of the parliamentary suffrage to those women who fulfill the qualifications of property and residence demanded of electors.

FAWKES, GUY (properly GUIDO), the head of the conspiracy known by the name of the gunpowder plot, was born of a Protestant family in Yorkshire, in the year 1570. He became a Roman Catholic at an early age, and served in the Spanish army in the Netherlands. Inspired with fanatical zeal for his new religion, on his return to England, he entered into a plot with several Catholic gentlemen for blowing up the king,

his ministers, and the members of both houses at the opening of parliament, 5th Nov., 1605. Guy F. was taken with the burning match in his hand, tried, and after having been put to the torture, was publicly executed Jan. 31, 1606. In remembrance of this event, in most English towns, but particularly in London, a grotesque figure, stuffed with straw, is carried about the streets on the 5th of Nov., and finally committed to the flames. A political and religious signification was again imparted to this custom by what was called "the papal aggression" in the year 1850, when the figure of cardinal Wiseman was substituted for that of Guy Fawkes.

FAY, ANDRÁS, a Hungarian author, was b. in 1786, at Kohany, in the county of Zemplén. After having studied philosophy and law at the Protestant college of Sáros-patak, F. was called to the bar. He held a situation for some time in the county of Pesth, which, however, he afterwards relinquished, in order to be able to devote himself altogether to literary pursuits. After two volumes of poetry, appeared the collection of fables (*Mesék*, Vien. 1820), and with the issue of that work F. obtained a decided reputation. The fables are like those of Phædrus and La Fontaine, but in prose. Richness of invention, simplicity of design, and truth of character, are the chief qualities for which the *Mesék* have become a household word among Hungarians. Among F.'s dramatic works may be mentioned the tragedy, *The Two Bathorys* (*A Két Báthory*, Pesth, 1827); the comedies, *Ancient Coins* (*Régi Penzek*), and *Hunters in the Matra* (*Mátrai Vadászok*). The novel, *The House of the Béltekys* (*A'Béltéky-haz*, Pesth, 1832), is rather of a didactic kind, but exhibits many features of Hungarian domestic life. Besides these, F. was a constant contributor to literary and scientific periodicals, and had also his share in some of those pamphlets by which great social questions, as, for instance, female education, savings banks, etc., were brought to a successful issue in Hungary. In reading F.'s works, we are frequently reminded of dean Swift. From 1825, which year may be said to have been the beginning of a new political life for Hungary, up to the year 1840, F. was foremost among the leaders of the liberal opposition in the county sittings of Pesth; but on the appearance of Kossuth, the strides of public life growing more and more rapid, F. gradually retired from the region of political controversy, turning his inventive mind to social improvements. The first savings bank of Hungary (at Pesth) was entirely F.'s work. His literary works were published in eight volumes at Pesth, in 1843–44. He was a directing member of the Hungarian academy of sciences. He died in 1864.

FAY, JONAS, 1737–1818; b. Mass.; a surgeon under Ethan Allen at the surrender of Ticonderoga; a member of the convention that declared Vermont an independent state; secretary of the state constitutional convention; one of the council of safety; member of the state council; judge of the supreme court; and agent of the state before congress, Jan., 1777; Oct., 1779; June, 1781; and Feb., 1782.

FAY, THEODORE SEDGWICK; b. N. Y., 1807; studied law, and was admitted to practice in 1828, but contributed to the *New York Mirror*, and subsequently became editor of that periodical. In 1832, he published *Dreams and Reveries of a Quiet Man*. After three years of European travel, he published his journal under the title, *The Minute Book*. In 1835, he published *Norman Leslie*, a novel, of which a second edition was issued the same year. From 1837 to 1853 he was U. S. secretary of legation at Berlin; and, 1853–60, resident minister at Berne, Switzerland. He has also published *Sidney Clifton; The Countess Ida; Hoboken; Robert Rueful; Ulric, or the Voices*, a poem; *Views of Christianity; Great Outlines of Geography; First Steps of Geography;* a *History of Switzerland;* and a series of papers on Shakespeare.

FAYAL, one of the most important of the Azores (q.v.), contains about 37 sq.m., and about 27,000 inhabitants. As one must infer from such density of population, the island is fertile. In its center is a mountain 3,000 ft. in height; and on its s.e. coast a convenient bay with good anchorage. Its principal town, Horta, stands on this bay in lat. 38° 30′ n., and long. 28° 41′ west.

FAYE'S COMET, discovered Nov. 22, 1843, in the constellation Orion; a bright nucleus with a short tail, but never sufficiently developed to be seen with the naked eye. Le Verrier showed that this comet came into our system as far back as 1747. It was rediscovered Nov. 28, 1850, by Chellis of Cambridge, and it came to perihelion Sept. 12, 1858. It was also seen in 1869. Its period is supposed to be nearly 7½ years, but it is too small to be of much interest. Its discoverer, Herve Auguste Etienne Albans Faye, a French astronomer, was born in, 1814. He became a member of the French institute, and was elected to the section of astronomy in 1841, and the bureau of longitudes in 1862. Two years later he entered the imperial council of public instruction, and was made an officer of the legion of honor. From 1848 to 1854, he was professor of geodesy in the *Ecole Polytechnique*, and in 1854 was chosen rector of the *Académie Universitaire* at Nancy. He has written valuable papers and text-books on astronomical science.

FAYETTE, a co. in n.w. Alabama; 684 sq.m.; pop. '70, 7,136—1077 colored. It is drained by the Sipsey and affluents of the Black Warrior rivers. Surface hilly and chiefly forest-land. Productions, cotton, corn, pork, etc. Co. seat, Fayette Court-house.

FAYETTE, a co. in w. Georgia, on Flint river; 240 sq.m.; pop. '70, 7,983—1121 colored. It has a varied surface, undulating or level, and is largely covered with timber. Cotton and corn are the chief productions. There are beds of iron ore and deposits of valuable granite. Co. seat, Fayetteville.

FAYETTE, a co. in s. central Illinois, on the Kaskaskia river, and the Illinois Central, and the St. Louis, Vandalia, and Terre Haute railroads; 786 sq.m.; pop. '70, 19,638. The surface is level, and much of it is covered with timber; soil fertile, producing corn, wheat, oats, hay, pork, etc. Coal and limestone are among the minerals. Co. seat, Vandalia.

FAYETTE, a co. in s.e. Indiana, on a branch of Whitewater river; traversed by the Whitewater canal, and the Cincinnati and Indianapolis Junction, and the Whitewater Valley railroads; 200 sq.m.; pop. '70, 10,476. Undulating surface and fertile soil, with considerable timber. The usual cereals are produced, and there is abundance of limestone. Co. seat, Connersville.

FAYETTE, a co. in n.e. Iowa, on the Burlington, Cedar Rapids, and Northern, and the Davenport and St. Paul railroads; drained by Turkey and Volga rivers; 720 sq.m.; pop. '75, 20,518. It has a prairie and forest surface, and produces wheat, corn, oats, hay, etc. Good limestone is found. Co. seat, West Union.

FAYETTE, a co. in n. central Kentucky, on the Kentucky river, intersected by the Cincinnati Southern, the Louisville, Cincinnati, and Lexington, and the Kentucky Central railroads; 320 sq.m.; pop. '70, 26,656—12,513 colored. The surface is varied, and offers some delightful scenery. The soil is very fertile, producing wheat, oats, corn, cattle, etc. Co. seat, Lexington.

FAYETTE, a co. in s.w. Ohio, crossed by the Dayton and Southwestern, and the Cincinnati and Muskingum Valley railroads; 414 sq.m.; pop. '70, 17,170. The surface is nearly level, and the soil deep and fertile, producing corn, wheat, cattle, pork, etc. Co. seat, Washington.

FAYETTE, a co. in s.w. Pennsylvania, on the border of West Virginia, intersected by the Youghiogheny river, and bounded by the Monongahela river; crossed by the Pittsburg, Washington, and Baltimore railroad; 800 sq.m.; pop. '70, 43,284. The surface is hilly, and largely covered with forests; soil fertile; chief productions, wheat, corn, oats, wool, pork, and butter. Co. seat, Uniontown.

FAYETTE, a co. in s.w. Tennessee, on the Mississippi border, crossed by the Nashville and Mississippi, and the Charlestown railroads; 676 sq.m.; pop. '70, 26,145—16,987 colored. Surface nearly level, with much forest-land. Products, wheat, corn, cotton, sweet potatoes, etc. Co. seat, Somerville.

FAYETTE, a co. in s.e. Texas, on the Colorado river, reached by the Galveston, Harrisburg, and San Antonio railroad; 1025 sq.m.; pop. '70, 16,863—5,901 colored. Surface undulating, and soil fertile; productions, cotton, corn, cattle, etc. Co. seat, La Grange.

FAYETTE, a co. in central West Virginia, bisected by the Kanawha river and the Chesapeake and Ohio railroad; 770 sq.m.; pop. '70, 6,647—118 colored. Surface rough, with fine mountain scenery; soil fertile, and adapted to cattle raising. Co. seat, Fayetteville.

FAYETTEVILLE is the name of a flourishing city of North Carolina, United States of America. Standing on the left bank of the Cape Fear river, about 140 m. from its mouth, F. marks the head of its natural navigation; while, by means of locks and dams, it communicates likewise with the upper basin of the river. While the interior sends down coal, the neighborhood is covered with forests of pine, which are traversed by 350 m. of plank-road, and yield tar and turpentine, of which latter there are several distilleries. Cotton and flour manufacture are largely carried on by water-power. The extensive arsenal of F. was seized by the confederates in 1861, and destroyed by Sherman in 1865. Pop. '70, 4,660, half of whom were colored.

FAYUM, the name of an Egyptian province, surrounded, in the form of a basin, by the Libyan desert, and connected merely by a narrow valley with that of the Nile, between lat. 29° to 30° n., and 30° to 31° east. This peculiar depression of the desert extends about 30 m. from n. to s., and about 40 m. from e. to w., its lowest point lying 100 ft. below the banks of the Nile at Benisuef. F. is one of the most fertile provinces in Egypt; producing, in addition to the ordinary useful plants of the country, roses, apricots, figs, vines, olives, etc., in great quantities. This fertility, in a province the soil of which is naturally arid and sandy, is the result of irrigation. A canal from the Nile was, at an early period, carried westward through a gorge in the Libyan hills, which here skirt the western bank of the Nile, and after dividing into numerous branches, lodged its waters in a depression in the n.w., thus forming, it is said, the lake Mœris (q.v.). The ancient capital of the province, called Krokodilopolis, and at a later period Arsinoë, stood on the eastern shore of lake Mœris, and upon its ruins stands Medinet-el-Fayûm, the chief town of the province, with a pop. of about 10,000 inhabitants.

FAZY, JEAN JAMES, 1796–1878; a Swiss statesman, educated in France, and connected with Parisian journalism. Returning to Switzerland in 1832, he was active in the

establishment of a new constitution, and of the introduction of trial by jury. In 1846, he was at the head of a provincial government of radicals in Geneva, and subsequently a conspicuous advocate of the new constitution. In 1853, he was vice-president of the federal council of states. He was again at the head of the Geneva government in 1855. In 1864, he was compelled to resign, and being indicted for complicity in the riots of that year, he fled to France, but subsequently returned, and occupied a seat in the grand council, which he resigned in 1865, but resumed again in 1868.

FEAL AND DIVOT is a predial servitude (q.v.) peculiar to the law of Scotland, in virtue of which the proprietor of the dominant tenement possesses the right of turning up and carrying off turf from the servient tenement for the purpose of building fences, roofing houses, and the like. This, as well as the servitude of fuel, implies the right of using the nearest grounds of the servient tenement on which to lay and dry the turf peats (q.v.) or feal. These servitudes do not extend beyond the ordinary uses of the actual occupants of the dominant tenements, and cannot be taken advantage of for such a purpose as to burn limestone for sale. They are not included in the servitude of pasturage, but must be constituted either by express grant, or by possession following on the usual clause of parts and pertinents. Ersk. ii. tit. ix. s. 17. The etymology of these words has been much disputed. *Feal* or *fail* is said to come from the Suio-Gothic *wall*, any grassy part of the surface of the ground; and Jamieson derives divot from *delve* (Sax. *delfan* or *delven*), or, as another alternative, says that it may have been formed by the monkish writers of old charters from *defodere*, to dig the earth. The former is the more probable conjecture.

FEALTY (Lat. *fidelitas*) is the fidelity which a man who holds lands of another owes to him, and contains an engagement to perform the services, or to pay the dues, for which the land is granted. It was embodied in an oath, by which the tenant bound himself on entering to the lands. In taking the oath of fidelity, Littleton says, s. 91, that the tenant shall not kneel, nor shall make such humble reverence as in homage. The only object of F. in modern times is to keep up the evidence of tenure where no other services are due; but even to this effect it has gone into desuetude.

FEAR, MANIA OF, or PANPHOBIA. There are many morbid manifestations of the instinct of cautiousness. Sudden fear in sleep, horrible dreams, nightmare, sleep-walking, have been regarded as symptoms of a special disease. Actual terror from irregular circulation in the sensory ganglia; the sense of falling or drowning in cardiac affections; incubus from disturbance of the circulation in the larger vessels by repletion, plethora, or position, where there is the superaddition of a delusion to the feeling of apprehension—are all allied and distinguished by involuntary and excited cautiousness. It is not only, however, when the intelligence may be supposed to be dormant, and the instincts awake, that such exaggerated fears paralyze minds otherwise sane and sound. Murat, "the bravest of the brave," and James I. of England, learned if not wise, were subject to vague, uncontrollable panics, which for a time unmanned them. The condition is often found associated with disease of the heart, as a consequence and concomitant rather than a cause. The presence of the *habitual* dread of evil, the fear of death, the sleepless and breathless anxiety during darkness, or solitude, or silence, as well as the sudden, wild, ungovernable panic, point to the existence of organic or functional diseases of the heart; and conversely, excited or irregular action of the organ, murmurs, angina, lead the astute psychologist to predicate fear as a characteristic of the mental condition. It precedes, and is believed to produce chorea, cancer, and scirrhus. Proximately, however, it depends upon alterations in the capillary circulation, or nervous structure of the brain. Its characteristic is involuntary, irresistible, blind terror, which arises and continues without an adequate cause, and which is not influenced by reason or religion, not even by the removal of the supposed object of alarm. The disease has appeared epidemically during commercial panics, during the horrors of cholera and plague, and in that singular affection called timoria, which is marked by debility, tremor, and terror, and has been traced to the effects of the damp, unhealthy regions in Sardinia and Sicily, where it exclusively occurs. Panphobia is hereditary, and has been traced through three successive generations. In reviewing the unobtrusive members of an asylum family, the pallid, startled, staring, flickering countenances may be detected as those of patients laboring under fear. They resemble melancholics in pallidity of skin, but in place of courting they shrink from sympathy; though horror-stricken by gloom, they hide in corners, they escape, they shriek in desperation, they climb trees, and apparently inaccessible places; and encounter real in order to elude fancied dangers; or they are motionless, paralyzed. They fear and flee from enemies, police, demons, death, punishment; indescribable agonies themselves.—Feuchtersleben, *Principles of Medical Psychology*, p. 281; Arnold, *Observations on Nature, Kinds, Causes, and Prevention of Insanity*, etc., vol. i. p. 257.

FEASTS. See FESTIVALS.

FEATHER, a river of California, and a feeder of the Sacramento, runs through one of the richest gold-fields in the state. It receives the Yuba near Marysville, which appears to mark the head of navigation—the distance down the F. and the Sacramento to the harbor of San Francisco being about 100 miles.

FEATHERFOIL, or WATER VIOLET, the *Hottonia inflata* of the United States, and *Hottonia palustris* of Europe, named from Peter Hotton, a Dutch botanist. It is a primulaceous plant, which grows submerged in water, but bears its blossoms, in the European species of great beauty, on long scapes sent up into the air.

FEATHER GRASS, *Stipa*, a genus of grasses remarkable for the long awns which give a peculiar and very graceful appearance to the species, mostly natives of warm temperate climates. In some of them, the awn is beautifully feathered. This is the case in the best known species, the COMMON F. G. (*S. pennata*), a very doubtful native of Britain, but found on dry hills in the middle and s. of Europe. It is a perennial, easy of cultivation, and a favorite ornament of our gardens. When gathered before the seeds are ripe, its feathery awns—sometimes a foot in length—remain attached, so that tufts of F. G. retain their beauty throughout winter, and form one of the most pleasing and familiar decorations of rooms. They are often dyed, to give variety to the decoration, but are never more beautiful than in their natural yellowish-white color. The feathery awns not only assist in the diffusion of the seed, which is carried by the wind to great distances, but in a very interesting manner help to fix it in the soil. The seed alights vertically, the furrowed base of the awn becomes twisted, so that its furrows form the threads of a screw, the feathery portion becomes horizontal, the wind acts on it, and the seed is screwed into the ground—a reverse action being prevented by stiff hairs which act as barbs.—The esparto (q.v.) of Spain is nearly allied to the common feather grass.

FEATHERS, a complicated modification of the tegumentary system forming the external covering or plumage of birds, and peculiar to this class of animals. Notwithstanding the varieties of size, strength, and color, all F. are composed of a quill or barrel; a shaft; and a vane, beard, or web, on either side of the shaft, the vane consisting of barbs and barbules.

The quill by which the feather is attached to the skin is wider but shorter than the shaft, and forms a semi-transparent, horny, cylindrical tube, which terminates below in an obtuse extremity, presenting an orifice termed the lower umbilicus. A second orifice, leading into the interior of the quill, and termed the upper umbilicus, is situated at the opposite end, where the two vanes meet and unite. The cavity of the quill contains a series of conical capsules fitted one upon another, and united by a central pedicle; and the whole structure presents a remarkable combination of strength and lightness.

The shaft is always of greater length than the quill, and tapers gradually to its free extremity; it is flattened at the sides, is more or less convex on the back, and presents a longitudinal groove inferiorly. It is composed of white, elastic, spongy structure, which is covered by a thin horny sheath.

At the point of junction of the shaft and quill, we usually observe—except on the F. of the wings and tail—a small supplementary shaft given off, which is furnished with barbs or fibers, and is termed the plumule or accessory plume. In the ostrich it is altogether absent; in the rhea, it is represented by a tuft of down; in the emu, on the other hand, it equals the original F. in size, so that the quill supports two shafts; and in the cassowary there is a second plumule of considerable size, so that the quill presents three distinct shafts.

The vanes or webs are composed of numerous barbs or small fibers arranged in a single series along each side of the shaft. They are fine prolongations of the outer coat of the shaft, are of a flattened form, and lie inclined towards the apex of the feather, with their flat sides toward each other, and their margins in the direction of the external and internal sides of the feather. The barbs are broader near the shaft than at the free apex, and in the large wing-feathers the convexity of one is received into the concavity of another. They are, however, generally kept in position by the barbules, which are minute curved filaments arising from the upper edge of the barb, much as the latter arises from the shaft. There are two sets of these barbules, one curved upwards, and the other downwards, and those of one barb hook so firmly into those of the next, as to form a close and compact surface. In the ostrich, the barbules are well developed, but are loose and separate, and it is this arrangement which gives to the F. of this bird their soft, plumous appearance.

F. present numerous gradations of structure. In the cassowary, the wings, instead of being provided with ordinary F., are furnished with five cylindrical stalks destitute of barbs, so that here we have merely the quill and shaft. On the breast of the wild turkey there is a tuft of F. resembling long black hair. In the *dasylophus cumingii*, the F. of the crest, breast, and throat are changed, at their extremities, into round, horny lamellæ, looking like shining black spangles; and in the common waxwing or Bohemian chatterer, some of the wing-feathers present at their extremities small horny expansions, resembling red sealing-wax, both in color and consistence.

Besides the common F., the skin of many birds, especially of aquatic species—in which plumules rarely exist—is covered with a thick coating of down, which may be described as consisting of very minute F., each of which is composed of a very small soft tube lying in the skin, from the interior of which arises a minute tuft of soft filaments, without any central shaft. This downy covering secures warmth without weight, like the soft fur at the base of the hair of arctic mammals. In most birds, the

skin also bears a good many scattered hair-like appendages, which indicate their relations to the ordinary F. by the presence of a few minute barbs towards the apex.

F. are developed in depressions of the skin, lined by an inversion of the epidermis which surrounds the bulb from which each feather springs; they grow, much in the same manner as hairs, by the addition of new cells from the bulb, which becomes modified into the horny and fibrous stem, and by the elongation of previously existing cells. They are, when first formed, living vascular parts, growing by nutrient vessels; but when they are fully formed, the vessels become atrophied, and the F. become dried up, and gradually die from the summit to the base. For a full account of the development of the different parts, we must refer to prof. Owen's article, "Aves," and to prof. Huxley's article, "Tegumentary Appendages," in the *Cyclopædia of Anatomy and Physiology*.

F. grow with great rapidity, and in some birds attain a length of more than 2 feet. They are almost always renewed annually, and in many species oftener; hence it may readily be conceived how much vital energy must be exhibited in their development, and how critical the period of molting must be. The plumage is generally changed several times before it attains the state which is regarded as characteristic of the adult bird; these changes may occupy a period usually ranging from one to five years.

Notwithstanding their extravascular nature, F., as is well known, undergo a change of color after they are completely formed. In yearling birds, the winter plumage, which succeeds the autumnal molt, gradually assumes brighter tints, the new color commencing at the part of the vane nearest the body, and gradually extending outwards till it pervades the whole feather. Dr. Weinland, an American naturalist, is of opinion, from a comparison of bleached specimens in museums, with recent ones taken from the bird, that the brightness and fading of the colors are due to the increase or diminution of an oily matter. Thus, the microscopic examination of the vane of F. from the breast of a fresh merganser showed numerous *lacunæ* containing a reddish oil-like fluid; some weeks after, the same F. having become nearly white from exposure to light, disclosed air-bubbles instead of the reddish fluid. If this fluid is an actual oil, as is most probably the case, it could make its way into the non-vascular tissue by mere physical imbibition; and on the varying quantities of this oil the variations of plumage would depend.

The property possessed by the plumage of most birds, of keeping the surface protected from moisture, is well known. This is due to two causes. Most birds are provided with an oil-gland at the base of the tail, whose secretion is distributed over the F. by means of the bill; and, additionally, the shedding of water is partly due to a thin plate of air entangled by the feathers.

The F. vary in form in different parts of the body, and afford zoological characters for the distinction of species. Hence, they have received distinct names, such as primaries, secondaries, tertiaries, etc., in ornithology. These terms are explained in the article BIRDS.

The chief uses to which F. are applied in the arts are three—*pens*, due to the peculiar elasticity of the barrels; *bed-feathers*, due to the combined softness and elasticity of the barbs; and *ornament*, due to the graceful forms and delicate tints of the whole feather. The mode of preparing the barrels for pens is described under QUILLS.

Bed-feathers were used in England in the time of Henry VII.; but it is not known how much earlier. At the present day, goose-feathers are preferred, the white rather than the gray. What are called *poultry* F., such as those of the turkey, duck, and fowl, are less esteemed, on account of their deficient elasticity. Wild-duck F. are soft and elastic, but contain an oil difficult to remove. The following is one among several modes of preparing F. for beds. Clean water is saturated with quicklime; the F. are put into a tub, the lime-water is added to the depth of a few inches; the F. are well steeped and stirred for three or four days; they are taken out, drained, washed in clean water, dried upon nets, shaken occasionally while drying, and finally beaten to expel any dust. The larger establishments, however, now prepare bed-feathers by steaming, which is found to be a more profitable and efficient process. The *down*, which is of so light and exquisite a texture as to have become the symbol of softness, is mostly taken from the breasts of birds, and forms a warm and delicate stuffing for beds, pillows, and coverlets. The most valuable is that obtained from the eider-duck, described under EIDER.

F. used for head-dresses, or other purposes of ornament, are selected according to the forms and colors which they display. The *ostrich*, a very valuable kind of feather, may be taken as an example of the way in which ornamental F. generally are prepared by the *plumassier*. The mode of catching the bird itself is noticed under OSTRICH; it suffices here to state that the hunters endeavor to avoid injuring the F. by blood or blows. When brought to England, the F. are assorted according to quality; those from the back and above the wings are the best, the wing-feathers next best, and the tail-feathers least valued. The F. of the male are rather more prized than those of the female. They are cleaned for use by repeated soakings and washings in water, sometimes with and sometimes without soap. There is also a process of bleaching by means of burning sulphur. When dried by being hung upon cords, the F. pass into the hands of the dresser, who opens the fibers by shaking, gives pliancy to the ribs by scraping them with bits of of glass, and curls the filaments by passing the edge of a blunt knife over them. If the F., whether of the ostrich or any other bird, remain in the natural

color, little more has to be done; but if a change of tint be required, the F. easily take dye-materials—such as safflower and lemon-juice for rose-color or pink, Brazil-wood for deed red, Brazil-wood and cudbear for crimson, indigo for blue, turmeric or weld for yellow, etc. A process of bleaching is adopted before the dyeing, except for black.

The kinds of F. chiefly used for ornament are those of the ostrich, adjutant, rhea or American ostrich, emu, osprey, egrett, heron, antrenga, bird of paradise, swan, turkey, peacock, argus pheasant, ibis, eagle, and grebe. White ostrich F. are prepared chiefly for ladies' head-dresses; and black for the Highland regiments and for funereal trappings. The white and gray marabout-stork F., imported from Calcutta, are beautifully soft and light, and are in request for head-dresses, muffs, and boas; the white kinds will sometimes sell for their weight in gold. The flossy kinds of rhea feather are used for military plumes, and the long brown wing F. for brooms and brushes. Osprey and egrett F. are mostly used for military plumes by hussar troopers. Bird of paradise F. are much sought after by oriental princes for turban-plumes. Cocks' F. are used for ladies' riding-hats and for military plumes. Dr. Macgown, who was United States consul at Ningpo a few years ago, has described, in the *American Journal of Science and Art*, an ingenious process which the Chinese adopt for combining brilliant-colored F. with bits of colored metal into garlands, chaplets, frontals, tiaras, and other ornamental articles.

FEATHER STAR, *Comatula rosacea*. An interesting member of the class of echinoderms, order of crinoids. It has a pentagonal disk or body composed of numerous polygonal plates from which spring ten slender, flexible, feathery arms, formed of numerous calcareous pieces placed end to end, but admitting of free motion. The arms are for locomotion and not prehension. The mouth is central and the alimentary canal is entirely contained in the disk or body, no part of it sending branches into the arms, as in asteroidæ. The feather star feeds upon minute organisms, which it draws into its stomach by the action of cilia in the alimentary canal. When young the animal is attached to a stalk, and has been mistaken and described as a distinct species under the name of *pentacrinus Europæus*. In attaining the adult state the animal becomes free. The genus *comatula* has a wide distribution, inhabiting most seas.

FEATHER-STONE, meaning, doubtless, *federal stone*, a stone table in the open air at which the ancient courts-baron were held, and where covenants were made.

FEB'IGER, CHRISTIAN, 1747-96; a revolutionary soldier, a native of Denmark. He was taken prisoner in Arnold's attack on Quebec, served honorably at Bunker Hill, Stony Point, and Yorktown, at the latter place commanding a Virginia regiment. In his later years he was treasurer of the state of Pennsylvania.

FEBRI'CULA (Lat. a little fever), sometimes called also ephemera (Gr. a fever of a day), a fever of short duration and mild character, having no distinct type or specific symptoms by which it can be distinguished and described. See FEVER.

FEB'RIFUGE (Lat. *febris*, a fever, and *fugo*, I drive away), a medicine calculated to remove or cut short fever (q.v.).

FEBRO'NIANISM, in Roman Catholic theology, a system of doctrine antagonistic to the admitted claims of the Roman pontiff, and asserting the independence of national churches, and the diocesan rights of individual bishops in matters of local discipline and church government. The name is derived from the *nom de guerre*, Justinus "Febronius," assumed by John Nicholas von Hontheim, coadjutor archbishop of Treves, in a work on these subjects, entitled *De Præsenti Statu Ecclesiæ*, which he published in the year 1767, and which, with its several successive volumes, led to a violent and protracted controversy, and elicited the severest censures of the Roman tribunals. See HONTHEIM, GALLICAN CHURCH.

FEB'RUARY, the second month of the year, has ordinarily 28 days, but in leap-year it has an additional or intercalary day. Among the Romans, it had originally 29 days in an ordinary year, but when the senate decreed that the eighth month should bear the name of Augustus, a day was taken from F., and given to August, which had then only 30, that it might not be inferior to July. The name is derived from the circumstance, that during this month occurred the Roman festival called the Lupercalia, and also Februalia, from *februare*, to purify.

FEB'RUUS (connected with Lat. *februare*, to purify) was the name of an old Italian divinity, whose worship was celebrated with lustrations during the month of Feb. The ceremonies instituted in his honor were believed to have the effect of producing fertility in man and beast. F., whose name in the Etruscan language is said to have signified god of the lower world, was also worshiped as such by the Romans, and identified with the Greek Pluto.

FECAMP, a manufacturing t. and seaport of France, in the department of Seine Inférieure, is situated in a narrow valley, flanked on either side by steep cliffs, at the mouth of a stream of the same name on the English channel, 23 m. n.e. of Havre. It consists mainly of one long street. Its principal building is the handsome church of Notre Dame, in the early pointed style, and dating from the 14th century. The harbor is frequented by colliers from Newcastle and Sunderland, and by Baltic timber-ships

and fishing-vessels. F. has cotton-mills, sugar-refineries, tanneries, ship-building yards, and some linen-cloth and hardware manufactures. Pop. '76, 12,074.

FECHNER, GUSTAV THEODOR, a German savant, b. 1801. After a course of study at Sorau and Dresden he studied medicine at Leipsic, where he became professor of physics. He has written largely upon chemistry, physics, anthropology, medical science, philosophy, and antiquities, besides poetry, criticism, and humorous literature. Among his more important works are *Nanna, oder über das Seelenleben der Pflanzen; Elemente der Psychophysik;* and *Physikalische und Philosophische Atomenlehre.*

FECHTER, CHARLES ALBERT, an actor of eminence, was b. in London about 1823, his father being a Frenchman. When only three or four years old, he went with his parents to France, and was there educated as a sculptor. His predilections were, however, in favor of the stage; and he soon became a popular actor. In 1860, he was announced to appear in an English version of *Ruy Blas* at the Princess's, and so perfectly identified himself with the character, that people almost forgot his French accent, in admiring the energy and finish of his acting. On the 20th of Mar. in the following year, he appeared in the character of "Hamlet." While abandoning the traditions of the English stage, F. showed himself capable of appreciating the difficulties he had to contend with, and in some measure of surmounting them. The impersonation was, upon the whole, one that marked F. as an actor of very high powers. The same may be said of his representation of "Othello." Subsequently F. became the lessee of the Lyceum theater, playing the chief part in most of the pieces produced. In 1870, F. paid a successful visit to the United States, where he thenceforward remained. There he died in Aug., 1879.

FECHTER, CHARLES ALBERT (*ante*), 1824–79; b. London. His father was of German and his mother of Italian descent. He was educated in France, and in 1840, appeared in private theatricals; in 1841, was with a strolling company playing at Florence, returning to Paris the same year and studying at the *conservatoire* with a view of entering the theater Française. For three years he studied sculpture, but gave it up for the stage, and in 1844 made his *début* in Paris as "Seyd" in Voltaire's *Mahomet.* Afterwards he played in Berlin, and in 1847 took a French company to London. From 1848 to 1860, he was the reigning favorite in Paris. He was the original "Armand Duval" in *Les Dames aux Camelias,* in which part he won remarkable success. In 1860, he made his first appearance in English drama in London in *Ruy Blas,* following with *Corsican Brothers, Don Cæsar de Bazan, Hamlet, Othello, Bel Demonio, Belphegor, Master of Ravenswood,* and as "Obenreizer" in *No Thoroughfare.* In 1870, he appeared in New York in most of these characters. He undertook to manage a theater in Boston, but did not succeed. In 1874, he appeared again in New York with Lizzy Price (who became his wife). Not long afterwards he retired to a farm in Pennsylvania, where he died.

FECKENHAM, or FECKNAM, JOHN DE, d. 1585; the last abbot of Westminster, and the last mitred abbot who sat in queen Elizabeth's parliament. He was chaplain to Bonner, bishop of London; and when the latter was deprived of his see, Feckenham was sent to the Tower. Although for much of the time a prisoner, he was active in political matters. Queen Mary released him and made him her chaplain. He was sent to lady Jane Gray, two days before her execution, to commune with her, and "to reduce her," says Foxe, "from the doctrine of Christ to queen Mary's religion." It is said that Elizabeth offered him the archbishopric of Canterbury; but that he refused it because he could not conform to the new (Protestant) faith. All his influence was thrown against the reformation and its doctrines.

FECULA, or FÆCULA, a term applied to starch obtained from various sources; in France, generally restricted to the starch of the potato. See STARCH.

FECUNDA'TION, or FERTILIZATION, in plants, takes place according to laws similar to those which prevail in the animal kingdom. In plants, however, the organs of reproduction are not permanent as in animals, but fall off—the male organs generally soon after fecundation, the female after the ripening of the seed. The male seminal substance, called *pollen,* never exists in a fluid state, but always in that of granules of various forms (*pollen grains*), which consist each of one cell, whose covering is of various thickness, and contains the impregnating substance. After the dehiscence of the anthers, the pollen gets into contact with the stigma of the pistil, which in its lowest and thickest part (the *ovary* or *germen*) contains the rudiments of the future seeds (*ovules*). The inner layer of the cell-covering of the pollen grain separates from the outer and thicker layer, as if it came out of a bag, and continuing to be elongated by growth, is carried down through the *style* to the germen, where it reaches the *foramen* or small opening of the embryo sac, and comes into contact with the ovule, or even in many cases penetrates into the ovule itself between its cells. By this time, one or other of the cells of the ovule has become considerably more enlarged than the other cells, and what is called the *amnion* has been formed, in the mucilaginous fluid of which (*protoblasma*), after the contact of the pollen-bag, through the dynamic operation of its contents, a *cell-germ* or *cytoblast* is soon developed. This cytoblast is the first commencement of a new and distinct cell, which divides into two cells. These

increase, by continually repeated separation of new cells, into a cellular body, which forms the more or less perfect *embryo* of a new plant. If the organ from which the pollen has proceeded, and the organ which contained the ovule, belong to the same plant or to plants of the same species, the embryo arising from this fecundation becomes a plant of the same species. But if the pollen by which the fecundation is affected comes from a plant of another species than that to which the plant belongs in whose germen the embryo is formed, the seed resulting from this fecundation will not, when it grows, produce plants of the same species, but *hybrids*, intermediate between the parent plants, and with various degrees of resemblance to one or other of them, but not perfectly corresponding with either. Hence the production of hybrids, and multiplication of varieties of plants in gardens, by what is called the artificial impregnation of the stigma of one plant with the pollen of another, which, however, must be of an allied species, hybridization being confined by the laws of nature within very narrow limits. See REPRODUCTION.

FECUNDATION (*ante*). One of the most interesting subjects of philosophical inquiry is that of insect fertilization of plants. Naturalists have long been aware of the fact that pistillate flowers, whether growing on the same trees with the staminate, or on different trees (monœcious or dicœcious), owe their fertilization to the agency of insects, which carry the pollen from the staminate to the pistillate flowers. Nearly all such plants have flowers which secrete a nectar attractive to insects, and this has been regarded as one of the numerous evidences of the agency of a designing providence; but still stronger evidence, if possible, is furnished by the fertilization of *perfect* flowers by insects. It has generally been thought that flowers bearing both stamens and pistils were always self-fertilizing, but this is not the case with many kinds. There is a provision by which several plants are prevented from in-and-in breeding, the parts of the flower being so arranged that it is impossible for the pollen to come in contact with the stigma. This is the case, among others, with the numerous family of *orchids;* and one of the most interesting works upon the subject was written by the advocate of the *Origin of Species by Natural Selection*, in which there is conclusive evidence that provision has been made, not only with the evident design of preventing self-fertilization, but also with the design of attracting the insect, which is made the agent of the fecundating act. (See *Fertilization of Orchids*, by Charles Darwin, London, 1862.) For the purpose of more perfectly insuring cross fertilization, in some flowers, the stamens precede the female organ in development, and shed their pollen before impregnation can take place, leaving the fertilization to be accomplished by the agency of insects, which carry the pollen from other flowers not so forward in development.

FEDERAL GOVERNMENT (Lat. *fœderatus*, bound by treaty, from *fœdus*, a treaty). When several states, otherwise independent, bind themselves together by a treaty, so as to present to the external world the aspect of a single state, without wholly renouncing their individual powers of internal self government, they are said to form a federation. The contracting parties are sovereign states acting through their representatives; and the extent to which the central overrules the local legislature is fixed by the terms of the contract. In so far as the local sovereignty is renounced, and the central power becomes sovereign within the limits of the federated states, the federation approaches to the character of a union; and the only renunciation of sovereignty which a federation as such necessarily implies, consists in abandoning the power which each separate state otherwise would possess of forming independent relations with foreign states. "There are," says Mr. Mill, "two different modes of organizing a federal union. The federal authorities may represent the governments solely, and their acts may be obligatory only on the governments as such, or they may have the power of enacting laws and issuing orders which are binding directly on individual citizens. The former is the plan of the German so-called confederation, and of the Swiss constitution previous to 1847. It was tried in America for a few years immediately following the war of independence. The other principle is that of the existing constitution of the United States, and has been adopted within the last dozen years by the Swiss confederacy. The federal congress of the American union is a substantive part of the government of every individual state. Within the limits of its attributions, it makes laws which are obeyed by every citizen individually, executes them through its own officers, and enforces them by its own tribunals. This is the only principle which has been found, or which is even likely to produce an effective federal government. A union between the governments only is a mere alliance, and subject to all the contingencies which render alliances precarious."—*Representative Government*, p. 301, 302. One of the chief difficulties which arise in organizing a F. G., consists in discovering by what means disagreements between one or more of the local governments and the central government as to the limits of their respective powers, are to be disposed of. The arrangement by which this object was sought to be effected in America, of which M. de Tocqueville expressed his admiration, is thus explained by Mr. Mill: "Under the more perfect mode of federation, where every citizen of each particular state owes obedience to two governments—that of his own state, and that of the federation—it is evidently necessary not only that the constitutional limits of the authority of each should be precisely and clearly defined, but that the power to decide between them in

any case of dispute should not reside in either of the governments, or in any functionary subject to it, but in an umpire independent of both. There must be a supreme court of justice, and a system of subordinate courts in every state of the union, before whom such questions shall be carried, and whose judgment on them, in the last stage of appeal, shall be final. Every state of the union, and the F. G. itself, as well as every functionary of each, must be liable to be sued in those courts for exceeding their powers, or for non-performance of their federal duties, and must in general be obliged to employ those courts as the instrument for enforcing their federal rights. This involves the remarkable consequence, actually realized in the United States, that a court of justice, the highest federal tribunal, is supreme over the various governments, both state and federal, having the right to declare that any new law made, or act done by them, exceeds the powers assigned to them by the federal constitution, and, in consequence, has no legal validity."—(P. 305.) "The tribunals which act as umpires between the federal and state governments naturally also decide all disputes between two states, or between a citizen of one state and the government of another. The usual remedies between nations, war and diplomacy, being precluded by the federal union, it is necessary that a judicial remedy should supply their place. The supreme court of the federation dispenses international law, and is the first great example of what is now one of the most prominent wants of civilized society, a real international tribunal. Mr. Mill's confidence in this remarkable tribunal, in which De Tocqueville shared, was disappointed. It proved unequal to the strain on the constitution caused by the political jealousies which in 1860 culminated in the great secession war. But, in ordinary circumstances, there is no reason to question its value in vindicating either federal or state rights.

FEDERAL GOVERNMENT (*ante*), a body-politic composed of the people of several different and in some respects independent states, over which, in its own prescribed sphere, it exerts a supreme authority; while outside of that sphere the states and the people thereof are sovereign within their respective jurisdictions. The character of a federal government varies with the extent of its powers. The first form of "federal government" established in this country was that of the "Articles of Confederation," adopted during the war of the revolution, July 9, 1778. The separate colonies, finding some form of central government indispensable to the efficient prosecution of the war of independence, gave a reluctant consent to those articles, which, while the war lasted, and all felt the presence of a common danger, worked tolerably, though not without some embarrassing friction arising from notions of colonial or state sovereignty. But after the independence of the country was established, and the pressure of a common danger no longer existed, there was a disposition to exalt the state, and to depreciate the national authority, which to some extent was regarded as a burden. The national government had no judicial tribunal to make an authoritative exposition of its powers, and no executive officers to enforce its decrees; it was entirely dependent upon the voluntary action of the states for means to carry on its operations; so that, in the language of Washington, it was "little more than a shadow without the substance," and "congress a nugatory body, their ordinances being little attended to." There was, in short, an utter want of all coercive authority on the part of the government to carry into effect its own constitutional measures. The embarrassments growing out of this state of things were endured till 1787, when a convention of delegates from the several states was held in Philadelphia "for the purpose of revising the articles of confederation and reporting to congress and the several legislatures such alterations and provisions therein as shall, when agreed to in congress and confirmed by the states, render the federal constitution adequate to the exigencies of the government and the preservation of the union." The convention encountered many difficulties arising from diversities of opinion among its members, and from conflicting local interests, but finally succeeded in framing a constitution which the people of the several states finally ratified, and which, with various amendments, has continued to this day. From the time of its adoption different theories of interpretation have prevailed, and these conflicting theories, to a greater or less extent, have determined the character and aims of political parties. It has been contended on the one side that the union was merely a league between the several states in their organized capacity, and that each state had the right, at its pleasure, of withdrawing therefrom. On the other side it has been held that the union, instead of being the creation of the states, as such, was formed by "the people of the United States," acting indeed through their respective state organizations, but still as citizens of a common nationality. According to this theory no right of secession on the part of a state has any existence, but it is the right and the duty of the national government to maintain the union by force. This question was brought to an issue in the late rebellion, the slaveholding states seeking to exercise the assumed right of secession for the protection of slavery, and the non-slaveholding states taking up arms for the defense of the union. The results of the war are generally regarded as a vindication of the anti-secession theory, though there are still some disputed questions as to the relative powers of the national and state governments.

Another example of federal government is afforded in the Dominion of Canada, founded in 1867 by a union of the provinces of Canada West, Canada East, New

Brunswick, and Nova Scotia, and afterwards enlarged by the addition of the provinces of Manitoba and British Columbia, the British territory, and Prince Edward island. These provinces have each its local legislature, while the government of the Dominion, essentially like that of the American union, extends over the whole territory. The government of the Dominion is administered by a governor-general appointed by and representing the British crown and exercising his authority with the aid of a council appointed by himself. The parliament consists of a senate of not more than 72 members, appointed for life by the governor-general; and a house of commons of 180 members, chosen by and representing the people of the several provinces. The different cantons of Switzerland are united under a common government in a similar way.

FEDERALIST, THE, a collection of essays in favor of the new constitution of the United States, with the exception of the concluding nine of the eighty-six numbers, originally published in *The Independent Journal*, a semi-weekly newspaper printed in New York, between the 27th of Oct., 1787, and the 2d of April, 1788. The authors were Alexander Hamilton, James Madison, and John Jay, who addressed themselves over the common signature of "Publius" in a series of letters "To the People of the State of New York," with the avowed purpose of securing the accession of that state to the constitution as proposed by the federal convention of Sept. 17, 1787. The essays have often been republished in a volume.

FEDERALISTS, the earliest political party organized in the United States after the achievement of liberty. The leaders were Washington, Adams, Hamilton, Jay, Marshall, and others of their rank and ability. In the French revolution, the federalists sympathized rather with England than with the party of Marat and Robespierre; and this gave occasion to Jefferson, who was ambitious to be president, to organize, in connection with Burr and others, a party called "republican," whose distinctive features were to intensify the natural feeling against England, and to accuse the federalists of being enemies of the masses of the people, of favoring an aristocratic government, and even of designs against the newly achieved liberties of the nation. The federalists had their own way in the elections for the first three terms, electing Washington twice and John Adams once; but in the canvass of 1796, Jefferson and Burr were the republican candidates. At that time, no discrimination was made by the electoral college between president and vice-president; each elector voted for two persons, the man having the highest vote took the first office, and the other went to the next highest. The vote was: Adams, 71; Jefferson, 68; Pinckney (fed.), 59; Burr (rep.), 30; with 46 votes scattered among nine others. Thus, we had a federalist for the first and a republican for the second officer. In 1800, Adams was again a candidate, with C. C. Pinckney (fed.), and Jefferson and Burr (rep.) opposed. The electoral vote showed for Jefferson, 73; Burr, 73; Adams, 65; Pinckney, 64. There being an equal vote between Jefferson and Burr, the house of representatives was compelled to elect, and the vote was taken by states. After 36 ballots, Jefferson got 10, and Burr 4 states, and two states voted blank. So Jefferson took the first office. In subsequent elections, the federalist candidates for president were Charles C. Pinckney in 1804 and 1808, De Witt Clinton in 1812, and Rufus King in 1816. Clinton had the largest electoral vote, 89 to 128 for Madison. In the struggle with England, the federalists were charged with hostility to the war; and with some show of reason. The capitalists and merchants of the country were chiefly of that party, and capital always dreads the disturbance of war. Although weak in votes they were strong in social and political position and influence, and were a constant source of fear to the more popular republicans. In 1814, the federalists committed suicide as a party by holding the famous Hartford convention, the motives and actions of which were construed, though unjustly, yet not unnaturally, to be directly opposed to the war, and little short of treasonable. In fact, the convention was opposed not to the war, but to the manner in which it was conducted, and to acts of the administration which they deemed oppressive and unjust to the New England states. See HARTFORD CONVENTION. The unmeasured denunciation of this convention overwhelmed what there was left of the old federal party, and it speedily passed out of consideration as a national organization. In the succeeding presidential election (1816), Rufus King got but 34 out of 221 electoral votes, and only three (Massachusetts, Connecticut, and Delaware) of the 19 states. The last appearance of a federalist candidate for president was in 1820, when their leader, John Quincy Adams, received one electoral vote (from New Hampshire) out of a total of 235.

FEDERAL THEOLOGY is the result of efforts to compress the doctrines of Christianity within the bounds of certain covenants conceived of as made between God and men. The essential idea of an ordinary covenant—that of a mutual compact between two parties by which each engages to render some benefit to the other—is indeed shut out by the nature of the case. When God and men are the parties, the benefit distinctively comes from him and the obligation distinctively rests on them. If the relationship exist between them, it must be determined and imposed by his sovereign right as a ruler. Yet it is more than a law or a promise. It includes a law to be obeyed, but the benefits far transcend the merit of the obedience. Mutual consent and obligation also are, in some sense, implied, as, on the one hand, God graciously binds himself to fulfill certain promises, and, on the other, men consent to the arrangement when, understanding the conditions prescribed, they enter on a course of obedience. Those who find advantage in

adopting this method of expressing Scripture truth, generally speak of two covenants, the one of works, the other of grace. In both they see the same contracting parties—God and man; the same blessing to be secured—eternal life; and the same requirement of perfect obedience: but in the covenant of grace there is a dispensation of mercy, through the divine Mediator, which secures eternal life. I. The covenant of works, though nowhere in Scripture spoken of under that name, is thought to be referred to or implied. Some, indeed, think that it is expressly mentioned in Hosea vi. 7, which they translate, "They, like *Adam*, have transgressed the covenant." The contrast and analogy which Paul traces between the first and second Adam would (they say) have no basis unless a covenant had been entered into with the one as well as the other. Several essential features of a covenant are (they think) to be seen in the constitution under which Adam was placed: 1. Eternal life was promised him on condition of his obedience; 2. He was constituted the representative of his race; 3. His powers were sufficient for the performance of the condition; 4. He would have secured eternal life for his descendants, as well as for himself, had he continued faithful; 5. The penalty of disobedience was death, natural, spiritual, and eternal, as each of these followed a forfeiture of a divine life. After a time (how long is not known) this covenant was broken on the part of man who, "being left to the freedom of his own will, fell from the estate in which he was created." II. The covenant of grace is the name given, according to the view of these theologians, to God's glorious appointment of salvation by grace. We may conceive of the race as fallen, and of a merciful provision being made by which a door is opened wide enough for all mankind to enter, with a system of means by which the actual salvation of a limited number will be secured. Or we may regard the eye of God as fixed first on a limited number of the fallen race, and for their sake alone providing an atonement, sufficient indeed for all men, but designed and efficient for the salvation only of that limited number. The latter is the aspect in which the covenant of grace is presented by some at least of its advocates. They suppose that God from eternity, anticipating the temporary character of the covenant of works, ordained another plan by which a portion of mankind would be saved from the ruins of the fall. Why he did not include the whole or a larger portion of mankind within the scope of his saving grace they prefer to leave where, they think, revelation leaves it—to the mere good pleasure of God. And, as the Bible speaks of some who were chosen in Christ before the foundation of the world, they infer that there must have been in eternity an agreement between the persons of the sacred Trinity, according to which a seed was given to the Son to serve him. Without ascribing to the transaction the technicalities of a human compact, they contend that something equivalent to it must have existed. And as men could not act for themselves, the Son of God acted for all those of whom he was to be the spiritual head. To constitute a natural ground for this headship, he was to become Man, uniting his divinity in one person with humanity. He would thus become the federal head of his spiritual seed (as Adam was of his natural descendants), and as such, acting as their representative, the Son would share with them the curse which the first sin brought on the human race, suffering even unto death in its most terrific form. Though these sufferings would not be the same as the doom which otherwise would have come on them spiritually and eternally, they are supposed to be of infinite value on account of his infinite dignity. They are indeed sufficient in objective worth to make expiation for any amount of sin in any number of worlds. They do actually confer innumerable benefits on all men. Through them pardon and salvation are offered to every one who hears the gospel: time, opportunity, and means of grace are afforded to all. But, it is agreed, all are not made partakers of salvation, and only a portion of mankind were eternally given to Christ. Plainly the success of his work was not left uncertain. A seed was secured to him by covenant; and it was with ultimate and supreme reference to these that he entered on his work. Such, it is declared, was the covenant of grace as formed in eternity. To this is to be added its accomplishment in time. The administrator of it is the Son of God himself, the mediator between God and man. He has power over all flesh, that he may give eternal life to as many as have been given him. He represented the divine ruler in all the merciful dispensations of which sacred history informs us. Although at different periods the outward forms of religion have been changed, the covenant of grace, which is the foundation of all, has always been the same. Believers before the flood, the patriarchs, Job and his friends, the Israelites under the Mosaic dispensation, looked for forgiveness under certain prescribed conditions, and for a city beyond the present world, whose builder and maker is God. All national restriction removed, and the Holy Ghost in his fullness given, the Christian dispensation is the ultimate form in which the covenant of grace will be administered. The Lord Jesus Christ will continue to be its head until the whole world is subdued unto him. Finally, the present economy of things will cease, the dead will be raised, the living changed, all men judged at Christ's bar, and sentence passed on them according to their works. Then having obtained full possession of his kingdom, the Son will deliver it to the Father, either as indicating the close of his mediatorial office, or perhaps only in token of the completeness and loyalty of his work. It may be noted here that there is a form of theology which, recognizing the great facts of salvation by God's eternal grace, and not denying that they may be made

to appear under terms of various covenants, deems it more natural and scriptural to set them forth under the terms of sovereign divine constitutions or ordainments.

FEE, ESTATE IN, the largest estate in land in point of quantity of estate known to the law of England, being a freehold (q.v.) of inheritance. Estates in fee are divided into fee-simple and fee-tail. A fee-simple is defined by Littleton (1, a.) to be a lawful and pure inheritance. In order to create an estate in fee-simple by deed, it is necessary that the word heirs should be used; for a gift by deed to a man forever, or to a man and his assigns forever, creates only an estate for life. But words of perpetuity annexed to a gift to a man by will are construed as carrying an estate in fee. The proprietor of an estate in fee-simple enjoys the fullest rights of property over his estate, which he may alienate or burden at pleasure, and out of which he may grant estates of a lower kind, as for life or years. He is owner of the soil "*a cœlo usque ad centrum,*" and is therefore entitled to every product of the land, as timber, etc., and to all minerals and other valuable productions found beneath the surface. On his death, the estate descends to his right heirs, except in the case of fees held by corporations, which descend to their successors in office. Where a man claims an estate in fee-simple in possession in a corporeal hereditament (q.v.), he is said to be "seized in his demesne as of fee." Estates in fee-simple are divided into fee-simple absolute, qualified or base, and conditional. A qualified or base fee differs from a fee-simple absolute by having a qualification annexed which may determine the estate, as where it is granted to a man and his heirs "tenants of the manor of Dale." If, therefore, at any time the holder of the estate ceases to be the tenant of Dale, the estate, which depended on that qualification, determines.

A *conditional fee* was limited to a particular class of heirs, to the exclusion of others, as to a man and the heirs-male of his body. On failure of heirs-male of the body of the grantee, an estate of this kind reverted to the grantor or his heirs. But although the estate was thus limited, by the terms of the deed, to a particular series of heirs, the judges previous to the reign of Edward I. held that the gift was a fee-simple on condition of the birth of heirs of the body of the grantee, and that on the birth of an heir of the body, the condition on which the estate was held was purified. The estate did not indeed become *ipso facto* a fee-simple absolute, but the grantee was held entitled to sell the estate, to forfeit it for treason, and to burden it with incumbrances. But if the estate was not sold, and descended to the heir, he continued to hold a fee-simple conditional. This state of things led to the famous statute *De Donis Conditionalibus* (13 Ed. I. c. 1), whereby it was enacted that estates should be held *secundum formam doni.* Estates created by this statute were called estates in *fee-tail.* See ENTAIL.

The original mode of transferring an estate in fee was by feoffment (q.v.), but the statute of frauds (29 Char. II. c. 3) requiring that writing should be used in all transfers of land, estates in fee must now be conveyed by deed or will.

The proprietor of an estate in fee-simple in the present day is substantially absolute owner of the freehold, which he holds without owing duty or service to any one, except the allegiance due to the sovereign, who is regarded as supreme lord of all the lands in the kingdom. But originally this was not so; an estate in fee is in its nature a feudal benefice, a feud, and the owner of the fee held his estate subject to all the services incident to the feudal state. But these duties have been by degrees entirely abolished in England. See FEUDAL SYSTEM, TENURES. In Scotland, the feudal usages in regard to land are still retained to a very great extent. See Paterson's *Compendium of English and Scotch Law.* An estate in fee in Scotland must be held by one of the three existing tenures, viz., feu, blanch, or burgage, and is subject to the casualties (q.v.) attaching to these rights.

FEE-FUND, in Scotland, is the fund arising from the payment of dues of court on the tabling of summonses, the extracting of decrees, and the like. Out of this fund, the clerks and other inferior officers of the court were paid. If the fund was at any time insufficient for the purposes to which it was applied, the deficiency was supplied out of the moneys provided by the acts 7 and 10 Anne for keeping up the Scottish courts of law. The offices of collector and accountant of the fee-fund were abolished in 1868, and the duty is now collected by stamps.

FEEJEE. See FIJI.

FEE AND LIFE-RENT (in the law of Scotland)—the first of which is the full right of proprietorship, the second the limited right of usufruct during life—may be held together, or may co-exist in different persons at the same time. The settling of the limits of the rights which in the latter case they respectively confer, is of very great practical importance, and, from the loose way in which both expressions have been used by conveyancers, by no means free from difficulty. "In common language," says Mr. Bell, "they are quite distinct; life-rent importing a life-interest merely, fee a full right of property in reversion after a life-rent. But the proper meaning of the word life-rent has sometimes been confounded by a combination with the word fee, so as in some degree to lose its appropriate sense, and occasionally to import a fee. This seems to have begun chiefly in destinations 'to husband and wife, in conjunct fee and life-rent and children in fee;' where the true meaning is, that each spouse has a joint life-rent while both live, but each has a possible fee, as it is uncertain which is to survive. The same

confusion of terms came to be extended to the case of a destination to parent and child —'to A. B. in life-rent, and the heirs of the marriage in fee'—where the word life-rent was held to confer a fee on the parent. It came gradually to be held as the technical meaning of the word 'life-rent to a parent, with fee to his children nascituri,' that the word life-rent meant a fee in the father. Finally, the expression came to be held as strictly limited to its proper meaning by the accompanying word 'allenarly,' or some similar expression of restriction; or where the fee was given to children nati and nominatim; there being in that case no necessity to divert the word life-rent from its proper meaning, or, on a similar principle, where the settlement was by means of a trust created to take up the fee." (*Prin.* s. 1712.)

FEELING. See EMOTION.

FEES. Neither barristers nor physicians could recover their fees by legal proceedings against their clients or patients, except under a special contract. The ground of this rule was that they are regarded not as payment, but as an expression of gratitude for services the value of which cannot be appreciated in money. The origin of the rule in the case of the advocates, is traced to the relation which subsisted between patrons and their clients in ancient Rome. When the former appeared as the defenders of the latter, they practiced, as Blackstone says (iii. 29, Kerr's ed.), *gratis*, for honor merely, or at the most for the sake of gaining influence; and so likewise, it is established with us that a counsel can maintain no action for his fees, which are given, not as *locatio vel conductio*, but as *quiddam honorarium;* not as a salary or hire, but as a mere gratuity, which a counselor cannot demand without doing wrong to his reputation. The rule at Rome was maintained even under the emperors, and Tacitus mentions (*Ann.* lib. ii. c. 5) that it was directed by a decree of the senate that these *honoraria* should not in any case exceed 10,000 sesterces, or about £80 of English money. It has further been decided in England, that no action lies to recover back a fee given to a barrister to argue a cause which he did not attend (Peake, 122). But special pleaders, equity draftsmen, and conveyancers, who have taken out certificates to practice under the bar, and therefore are not counsel, may recover their reasonable charges for business done by them (Poucher *v.* Norman, 3 B. and C., 744). Another rule with reference to the fees of barristers and advocates is, that they are paid before they are earned; a rule which, by removing from its members all pecuniary interest in the issue of suits, has done much to maintain the independence and respectability of the bar. As regards physicians, the rule that a fee could not be recovered by an action at law, was applied in the case of Chorley *v.* Bolcot, June 30, 1791 (4 T. R. 317). If, however, either a barrister or a physician acted under a special agreement or promise of a certain payment, then an action might be brought for the money. But all medical practitioners were relieved from the above code of honor by the act of 21 and 22 Vict. 90, which applied to the United Kingdom, and enabled them to recover in any court of law their reasonable charges as well as costs of medicines and medical appliances used. This rule applies to physicians, surgeons, and apothecaries as defined by the statute. Members of the inferior branches of both professions—attorneys, solicitors, etc., on the one hand, and surgeons, dentists, cuppers, and the like on the other—were always entitled to raise action for their fees. In Scotland, the same rules prevail as in England with reference to both professions. In France, though the delicate sense of honor of the bar has always been preserved with quite as much care as in England, the rule is somewhat different. In law, an action for the recovery of fees would be maintainable in that country by an advocate; but "in Paris, the rule of the ancient bar, founded on the disinterestedness which was its characteristic, and according to which any judicial demand of payment of fees was strictly forbidden under pain of erasure from the table (of advocates), has been religiously preserved." *History of the French Bar*, by Robert Jones, 1855. The practice in France, however, seems to be for the fees of advocates to be paid afterwards, though any bargain with the client or his agent that their amount shall depend on the issue of a trial, is regarded as dishonorable, and on several occasions the bar has vehemently resisted regulations calling on them to acknowledge receipt of their fees, as wounding their sensibility. There can scarcely be a stronger proof of the value of what seem in themselves to be trifling and pedantic pieces of etiquette, than the dignified and independent position, which, from its scrupulous sense of honor, the French bar has maintained during all the political revolutions which the country has undergone.

FEHÉRVÁR (SZÉKES), the same as the Latin *Alba Regia*, or the German *Stuhlweissenburg*, is one of the most ancient royal free towns of Hungary, situated in a marshy district about 40 m. s.w. of Pesth. Under the Arpádian kings, it was the metropolis of the realm, and the residence of the sovereigns, who have been often crowned and buried there. On many occasions, the diets also were held in F., where twelve kings—among which are St. Stephen, and the great Mathias Corvinus—lie buried. It is the seat of a bishop, and contains a pop. of (1869) 22,683, chiefly Roman Catholics, and all of the Magyar race. Water is supplied by an artesian well.

FEHMIC COURTS, or VEHMGERICHTE. See FEHMGERICHTE, *ante*.

FĔÏ'A, a large lake of Brazil, lies on the maritime border of the province of Rio Janeiro, and is distant 150 m., to the n.e., from the city of the same name. It is so near to the Atlantic that it has been connected with it by means of a canal. F. is about a degree to the n. of the southern tropic.

FEIGNING OF DISEASE is much practiced in the army and navy, and also by convicts and others anxious to escape from discipline, or procure a discharge from compulsory service. In the army, it is technically called *malingering*. The detection of feigned disease, of course, necessarily belongs to the highly educated physician, and is impossible without a thorough knowledge of the reality, unless, indeed, the imitation be very coarse and badly studied. The diseases most commonly simulated are epilepsy, catalepsy, convulsions, blindness, deafness, palsy, insanity, indigestion, neuralgia, rheumatism, palpitation of the heart, and generally all disorders which may exist without leading to any distinct external appearances. Ulcers of the legs, however, have often been made, and kept open artificially through the application of irritant substances; and vomiting or coughing up of blood is very easily simulated, if the supposed patient can get access to the necessary materials in the slaughter-house or elsewhere. The detection of such impostures is easy or not according to the opportunities and knowledge and skill of the deceiver, as compared with those brought to bear on the discovery of the fraud. Many men in the public services, and women affected with hysteria, have become so expert as to deceive even men of high character and skill. The writer has known of an instance in which a man submitted to successive amputations of the arm upwards nearly to the shoulder, for an ulcer produced and kept open at will by local applications; and a case was some time ago recorded by Dr. Murchison in the *Medico-chirurgical Transactions*, in which there is no reasonable doubt that a large opening into the stomach was the result of caustic substances deliberately applied to the abdomen, with the view of exciting sympathy.

FEINT (from the Fr. *feindre*), in military or naval matters, a mock attack or assault, usually made to throw an enemy off his guard against some real design upon his position. See FENCING.

FEITH, RHIJNVIS, a distinguished Dutch poet, who ranks next to Bilderdijk (q.v.) as a reviver of the national poetry, was b. 7th Feb., 1753, at Zwoll in Overyssel, studied law at Leyden, and returned to his native town in 1776, where he held the office of burgomaster. He died 8th Feb., 1824. F. tried almost all kinds of poetry. In his earlier productions, he showed an excessive inclination for the sentimental; but in 1792 appeared his *Het Graf* (The Tomb), a didactic poem, which, though not free from the weakness referred to, is yet on the whole happily conceived, and contains some admirable passages. His *De Ouderdom* (Old Age), published in 1802, is deficient in plan. Among his lyrical pieces, *Oden en Gedichten* (Odes and Miscellaneous Poems, 4 vols., Amst. 1796–1810), are several marked by a high enthusiasm and warmth of feeling. Of his tragedies, the best known are *Thirza* (1791); *Johanna Gray* (1791); and *Ines de Castro* (1793). Along with Bilderdijk, he recast in a nobler form Haren's famous patriotic poem, *De Geuzen* (Les Gueux, or the Beggars), which celebrates the first struggles of the Dutch for independence. Of F.'s prose works, the most important are *Brieven over verscheiden Onderwerpen* (Letters on Different Subjects, 6 vols., Amst. 1784–90). These letters, by their polished style and refined criticism, did much to improve the literary taste of Holland.

FEKE, ROBERT, one of the earliest of American artists, his portraits dating back to about 1746. He settled in Newport, R. I., but visited Philadelphia, New York, and other cities professionally. It is said that when young he was made a captive and taken to Spain, where he employed himself in making sketches, from the proceeds of which he was enabled to return home.

FELANITCHE', or FELANITZ (anc. *Canatix*), a t. of the island of Majorca, 27 m. e.s.e. from Palma. It is situated in a valley, surrounded by mountains, and is well built, with a number of squares and wide streets. It has a convent and a hospital. On a neighboring hill is an ancient Moorish castle, with subterranean vaults. Linen and woolen fabrics are manufactured; rope-making and brandy-distilling are also carried on. There is some trade in the products of the neighboring country—rice, coffee, sugar, wine, brandy, fruit, and cattle. Pop. 8,102.

FELDKIRCH, the chief t. in the Voralberg district, Tyrolean Austria, at the junction of the valleys of the Rhine and the Ill, 6½ m. above the confluence of the two rivers; pop. '69, 2,868. It is a place of considerable trade, and has manufactures of cotton, metals, etc. It is the seat of a bishop, and has a Jesuit seminary and a Capuchin monastery. Near the place are the ruins of the castle of Schattenburg, where the counts of Montfort had their seat.

FELDMANN, LEOPOLD, a German writer of comedies, was b. at Munich in 1802, of Jewish parents, to whose faith he remains attached. Apprenticed in 1815 to a saddler, and afterwards to a cobbler, he soon gave evidence of his determination to be a poet by sending, in a pair of shoes, which he had mended, a poetical expression of his devotion to their fair wearer. For this his master sent him back to school, where in 1817, when only 15 years old, he wrote a play, *Der Falsche Eid* (The False Oath), which was actually

produced on the stage. After spending a few years in business at Pappenheim, and subsequently in Munich, he was induced, by the reputation which he gained from some humorous pieces, entitled *Genrebilder*, to devote himself entirely to literature. In 1835, his *Höllen-lieder* (Hell-Songs) appeared; and his first comedy, *Der Sohn auf Reisen* (The Son on his Travels), was acted in Munich with applause. While traveling thereafter for five years, chiefly in Greece, he wrote "Pictures of Travel" for Lewald's *Europa*, and the correspondence for the *Allgemeine Zeitung*. In 1841, his comedy was produced in Vienna, and since 1850, he has been employed as histrionic teacher in the national theater of that capital. F.'s works, which are numerous, are reckoned among the best specimens of modern German comedy, pleasing by their cheerful humor, and happy employment of contemporary ideas and events, though complained of as deficient in artistic finish. F. has published a collection of his comedies *Deutsche Originallustspiele* (Original German Comedies), 1844–52; new series, 1855–57.

FELDSPAR (Ger. *feldspath*, field-spar), a mineral extremely abundant in almost all parts of the world. It is a principal constituent of many rocks, as granite, gneiss, greenstone, trachyte, etc.; and clays seem very generally to have resulted, at least in great part, from its decomposition. It occurs both massive and crystallized, in rhomboidal, pyramidal, and prismatic crystals, often having their edges and angles truncated, and thus very variously modified. There are many different kinds of F., which mineralogists have recently attempted to arrange in mineral species, distinguished by physical and chemical characters, and also by geognostic position, and by the groups of minerals with which they are associated. For these mineral species new names have been invented, *orthoclase*, *oligoclase*, *albite*, *labradorite*, etc. All the feldspars are anhydrous silicates of alumina, and of an alkali or lime. Orthoclase, and the other more silicious feldspars containing potash, abound chiefly in granite and the *plutonic* rocks; the less silicious, containing soda and lime, characterize the *volcanic* rocks—"as labradorite the basaltic group, glassy feldspar the trachytic." All the kinds of F. are so hard as not to be easily scratched with a knife, and are fused with difficulty. Some of them are soluble, some insoluble in acids.—The kind known as COMMON F.—referred to *orthoclase*—is generally white or flesh-colored, has a glassy and somewhat pearly luster, is translucent at least on the edges, and has an uneven or splintery fracture. Crystals four or five inches long are found in Aberdeenshire. This variety, under the name of *petunse* or *petuntze*, is used by the Chinese in the manufacture of porcelain; along with some of the quartz which is associated with it in the rock. It is used, with other materials, as a flux; and alone to form an enamel or glassy covering, without which the porcelain would absorb moisture and grease, and would be unfit for any except mere ornamental purposes.—ADULARIA is a transparent and almost colorless variety of F., often cut as an ornamental stone, the finest varieties, of which one is known as MOONSTONE, being prized almost as gems. A variety, found among rolled stones in Ceylon, and remarkable for the reflection of a pearly light, has been sometimes confounded with *cat's eye*.—AVANTURINE F. is similar to the variety of quartz called *avanturine* (q.v.) in the play of light which it exhibits, and which is said to be owing to minute crystals of specular or titanic iron. It is much esteemed as an ornamental stone. A variety with golden yellow specks, called SUNSTONE, is very rare and very beautiful: it sells at a high price.—LABRADORITE exhibits rich colors and a beautiful opalescence, on account of which it is much used for ornamental purposes.—A blue variety of F., found only in Styria, and a green variety, sometimes called *amazon stone*, are also esteemed as precious stones.—All the finer varieties of F. are characterized by a soft beauty, which well compensates for the want of that brilliancy which belongs to the true gems.

Kaolin, or *porcelain clay*, is regarded as a decomposed feldspar.—To F. also are referred, as chiefly composed of it, or apparently derived from it, felstone, trachyte, claystone, clinkstone, pitchstone, obsidian, and pumice.

FELEGYHA'ZA, a t. of Little Cumania, Hungary, is situated on the railway between Pesth and Temesvar, 67 m. s.e. from the former. It has an extensive trade in grain, fruit, wine, tobacco, and cattle. In the neighborhood, several Roman urns have been found. Pop. '69, 21,313.

FELI'CE, FORTUNATO BARTOLOMMEO DE, 1725–89; an Italian author; studied in Rome and Naples under Jesuit teachers. Having abducted a nun from a convent he fled to Switzerland, settled at Berne, and became a Protestant. He subsequently founded a school and a printing-office at Yverdun, where he published a literary periodical and some political works. His chief work was an *Encyclopædia* in 48 quarto vols. with 10 vols of illustrations, in which he was assisted by Euler and others.

FELICITAS, SAINT, a Christian martyr who with her seven sons suffered death in the 2d century. All were arraigned together, and all refused to renounce Christianity. The mother was beheaded, and the sons were killed in various manners. Another St. Felicitas suffered death with St. Perpetua under Caracalla about the beginning of the 3d century.

FELICU'DI. See LIPARI ISLANDS.

FE'LIDÆ, or FELI'NÆ, a family of digitigrade carnivorous quadrupeds (see CARNIVORA and DIGITIGRADA) corresponding to the genus *felis* of Linnæus, and sometimes

collectively called *cats* or the *cat tribe*. They are, generally speaking, the most carnivorous of all the *carnivora*, holding the same relative place among quadrupeds that the *falconidæ* do among birds. Their organization is admirably suitable to their habits. They have a very lithe muscular frame; the body is rather long, and remarkably flexible; the limbs generally short. Few of the species possess much fleetness, but most of them excel in climbing and in leaping. When moving rapidly over the surface of the ground, they generally advance by a series of zigzag bounds, rather than by direct running. They are mostly inhabitants of forests, and many even of the larger species live much among the branches of trees, although some of the largest do not leave the ground. They all advance stealthily on their prey; which all of them kill for themselves, and devour in a perfectly fresh state, and generally whilst still warm and quivering. When they have approached within a sufficient distance, they complete the seizure by a spring, many of them uttering a roar or yell as they do so, and thus rendering their victory more secure by the consternation which paralyzes the object of their attack. Their movements are extremely noiseless, owing to the soft velvety pads with which their toes are provided. Their claws are strong, much curved, very sharp, and retractile; being withdrawn by special muscles and ligaments into sheaths when not in use, and their points even turned upwards, so that they are not blunted by unnecessary friction, and do not interfere with the movements of the animal by accidentally hooking objects which are in the way. The last bone (*phalanx*) and joint of the toe exhibit peculiarities requisite for the extension and retraction of the claws. The fore-feet have five toes, the hind-feet four. The head of the F. is characterized by great breadth of skull, whilst the muzzle is short, and sometimes even rounded; the jaws are moved by very powerful muscles, and the articulation of the lower jaw is such that it has no rotatory motion; the teeth also being so shaped, and those of the two jaws so fitting to each other, that they cut like scissors—the lower teeth shutting within the upper—and are not at all adapted to the trituration of food. There are six small incisors in each jaw, followed on each side by one very large canine tooth, adapted for prehension; and this by two premolars, or false molars, which, particularly in the lower jaw, are compressed and sharp-edged, their edges rising to a central summit, with inferior lateral cusps, so that flesh between them is subjected to a cutting action in various directions. Finally, there is on each side of each jaw one true molar, and in the upper jaw of many species, a second true molar. The crowns of all the teeth are covered with enamel. The tongue is rough, with horny papillæ directed backwards, by which it is fitted for cleaning the bones of the prey. The stomach is simple, the intestines short, and digestion rapid. The senses of sight and hearing are extremely acute; the eyes are adapted to seeing both by day and by night; the sense of smelling is also very acute, although apparently not equal to that of dogs; the sense of taste is supposed to be less acute; the bulbs from which the long whiskers arise appear to possess the sense of touch in great perfection, and the whiskers thus become useful in the progress of the animal through entangled thickets.

The F. agree so much in form and structure, that many naturalists still refuse to divide the Linnæan genus *felis*. None of the F. are gregarious. Almost all of them, when taken young, seem capable of domestication, but in general they are little to be trusted. The species are numerous. They are distributed over Europe, Asia, Africa, America, and the islands adjacent to these continents; but none are found in Australia, where their place is supplied by the carnivorous marsupial quadrupeds. The largest species are chiefly found in warm climates. No species is known to be common to the old and new worlds, although some are very nearly allied.

Vast numbers of the larger F. were brought from Africa and the east for those savage sports and shows in which the ancient Romans delighted. Five hundred lions were slain in five days at the opening of Pompey's theater, and five hundred panthers have been let loose at once in a similar Roman arena. The wealth of Indian princes has also been often spent in fights of such beasts.

The principal F. are noticed in separate articles, as LION, TIGER, JAGUAR, PUMA, LEOPARD, PANTHER, CAT, TIGER-CAT, LYNX, CHEETAH, OUNCE, CARACAL, SERVAL, OCELOT, etc.

FE'LIX (POPE) I.-IV.—FELIX I., reckoned the 26th in the succession of popes, succeeded Dionysius in the see of Rome probably in the year 269. His pontificate is chiefly interesting as an early example of the relations of the Christian church to the Roman empire, and of the recognition by the state of the civil rights of Christians. In the pontificate of F.'s predecessor, Dionysius, Paul of Samosata, bishop of Antioch, had been deposed by a council held in that city. Paul having resisted the sentence, the matter was laid before F., Dionysius being now dead; and, as Paul held possession of the church and church buildings, the bishops were obliged to claim the interference of the emperor Aurelian, who was passing through Antioch on his return from Palmyra. Aurelian returned a decision which is often appealed to in modern controversy, to the effect that the buildings should belong to the person "to whom they should be adjudged by the bishops of Italy and Rome." F. afterwards suffered martyrdom in the persecution of the same emperor, Aurelian, probably in 274.—FELIX II. occupied the Roman

see during the banishment of Liberius, in 355. It is agreed on all hands that his first appointment was intrusive, but much diversity of opinion exists as to his subsequent career. In reply to a petition for the recall of Liberius, it was proposed by the emperor Constantius that Liberius and F. should exercise jurisdiction jointly; but this proposition was rejected by the Romans, and F. appears to have been compelled to retire from the city. According to the *Liber Pontificalis*, he suffered martyrdom in the end, at the hands of his former patron, Constantius; but this is not confirmed by any contemporary authority.—FELIX III. occupied the see of Rome from 483 till 492. He was a native of Rome, and of the family from which afterwards sprung pope Gregory the great. His pontificate is historically memorable, as presenting the first commencement of the disruption of the Greek and Roman churches. The contemporary occupant of the see of Constantinople, Acacius, as well as the imperial court, was a favorer of the Monophysite party, who refused to accept the decision of the council of Chalcedon. See MONOPHYSITES. By their influence, the patriarch of Alexandria was deposed, and replaced by the Monophysite, Peter Mongus. The deposed patriarch having appealed to Rome, F. sent two legates to Constantinople, to require his restoration; and the legates having failed in their trust, and Acacius still adhering to the heterodox party, F. assembled a council at Rome, and excommunicated not only the offending legates, but also Acacius himself, the sentence being pinned by a monk upon the back of the patriarch's robes while he was actually officiating in the church. F. had previously rejected the *Henoticon*, or decree of union, published by the emperor Zeno. The schism thus inaugurated was not healed till the year 519. The only literary remains of this pontiff are the letters and other acts of this controversy. He died Feb. 24, 492.—FELIX IV., a native of Benevento, succeeded John I. in 526. His pontificate presents no noteworthy event. He died in 530.—FELIX V. (anti-pope). See AMADEUS.

FE'LIX, ANTONIUS, a Roman procurator of Judea (51-62 A.D.) in the time of the apostle Paul, was a freedman of the emperor Claudius I. The circumstances under which he received his appointment are related differently by Tacitus and Josephus. His government, politically considered, was in some respects good. According to Josephus and other authorities, he cleared the country of robbers, and vigorously suppressed the chaotic seditions of the Jews; but his cruelty, lust, and greed were unbounded. His wife was Drusilla, a beautiful but renegade Jewess, whom he had induced to abandon her first husband, and to form a questionable connection with himself. It was therefore not at all wonderful that F. should tremble as Paul reasoned of "righteousness, temperance, and judgment to come" (Acts xxiv. 25). He was recalled to Rome, 62 A.D., on account of the accusations preferred against him by the influential Jews of Cæsarea, and narrowly escaped the sentence of death.

FELIX, CELESTIN JOSEPH, a French preacher, b. 1810; studied at Cambrai, and entered the Jesuit novitiate in 1837. He completed his theological studies at Brugelette, Louvain, and Laval, and was appointed professor of rhetoric at Brugelette. In 1851, he preached the advent sermons in the church of St. Thomas d'Aquin, in Paris, and the next year the Lenten lectures in the church of St. Germain de Prés. In 1853, he succeeded Lacordaire and Ravignan in the pulpit of Notre Dame, which he occupied till 1869. He became the superior of his order in Nancy, and in 1871 superior of the Jesuit residence in the rue de Sèvres, Paris. Many of his sermons have been published.

FELIX, MARCUS MINUCIUS, a Roman lawyer and Christian, author of *Octavius*, a dialogue in defense of Christianity. He lived in the early part of the 3d century.

FELIXIANS, a Spanish sect of the latter part of the 8th c., so called from Felix, bishop of Urgel. See ADOPTIAN CONTROVERSY.

FEL'LAH (plural EL FELLAHIN), an Arabic word meaning peasant or agriculturist, specially applied to the agricultural or laboring population of Egypt by the Turks, in a contemptuous sense, as "clowns," or "boors." They form the great bulk of the population, and are descendants of the ancient Egyptians, intermingled with Syrians, Arabs, and other races who have been converted to Islam. In their physical conformation and features, they differ among themselves, those of the northern provinces of the Mediterranean being of whiter hue, while at Assouan they are almost black. They are described as having a large skull, facial angle almost 90 degrees, oval face, arched eyebrows, deep eyes, projecting lips, large mouth, thin beard, short nose, large chest, and small belly; arched back, and small hands and feet, and being of mean height. They form the fourth class of the population, and are distinguished from the Bedouin or free Arabs, who have entered the country later than the Saracenic conquest, and the Arabs of the towns and villages. Their dress consists of a shirt and linen drawers, over which is a larger blue shirt (*herie*), girdled by a leather or stuff belt, which is exchanged in the winter for a coat with sleeves (*zabout*). On their head, they wear the *tarboush*, turban, or a black or gray cap; the women tattoo themselves, and are nubile at an early age, being often married at 11 years, mothers at 12, and grandmothers at 24. The food of the Fellahin consists entirely of vegetables, which they eat in a crude state, dhourra bread, and beans. Even rice is too dear for them, and animal food unattainable. Their

drink is limited to the waters of the Nile and coffee, and the only luxury which they enjoy is the green tobacco of the country; yet on this diet they are robust and healthy, and capable of much labor and fatigue. In their social position, they are inferior to the Bedouin, who, although they will marry the daughters of the Fellahin, will not give to them their own in marriage. They appear to exhibit the moral qualities of the ancient Egyptians, being intelligent, grave, and calm, docile, pliable, and sober on the one hand; and idle, jealous, quarrelsome, satirical, licentious, and of unbending obstinacy, on the other, and inherit the traditional hatred of their ancestors to the payment of taxes, which are often only extorted by the bastinado. Their political condition is most miserable. Each village is governed by a sheik-el-beled, who is responsible to the nazirs and mamours, or district officers, for the conduct of the inhabitants, and their due payment of taxes. So oppressive, indeed, is the taxation and extortion, scarcely $\frac{1}{10}$ of the produce falling to their lot, that it would not be possible for them to live if it were carried to a higher pitch, and none cultivate the lands with diligence unless compelled by their superiors.—Gliddon, *Types of Mankind*, p. 319; Lepsius, *Egypt and Ethiopia*, p. 76; Lane, *Manners and Customs of Modern Egyptians*, pp. 125, 126, 192, 193; Clot Bey, *Aperçu générale*, i. pp. 159, 160.

FELLATAHS, or FOULAHS, a people of Africa occupying the valley of the Niger between Timbuctoo and Dahomey. About the middle of the last century they became converts to Mohammedanism, and, abandoning their nomadic life, formed independent states and conquered some of the neighboring peoples. At present the region under their control is estimated at 300,000 sq.m., and their numbers at 6,000,000. Their color, as a rule, is black, intermixed with a striking copper hue, some of them being hardly more dark than gypsies; and their hair is much less woolly than that of negroes. They live in clean habitations and are industrious. Children of both sexes are taught to read and write. The men wear swords at all times. The Fellatahs are almost constantly at war with the Arabs.

FELLENBERG, PHILIP EMANUEL VON, the founder of the institution for the improvement of education and agriculture at Hofwyl in the canton of Bern, in Switzerland, was b. at Bern in 1771. His father was a man of patrician rank, and in consequence, a member of the government. From him F. received a very careful education; but it was his mother, a great-granddaughter of the famous Dutch admiral, Van Tromp, who inspired him with the ardent desire of being useful to his fellow-creatures. In 1789, he went to the university at Tübingen, for the purpose of studying law, and subsequently traveled in various parts of Europe, taking up his quarters not in the hotels of the large towns, but in the cottages of the peasantry, that he might know at first hand the real condition and the manners of the poor, as well as the kind of education received by those whose life was to be spent in agricultural pursuits. When the revolution of 1798 broke out in Switzerland, F. took part in it for some time; but the faithlessness and want of public spirit on the part of the Bernese government induced him to withdraw from political life altogether, and to devote himself solely to philanthropic schemes. He now purchased the estate of Hofwyl, near Bern, and soon after entered into an alliance with Pestalozzi, the educationist. Their different characters, however, rendered such a union impracticable, and they found it necessary to separate. F. now proceeded with redoubled zeal to increase the produce of his estate by new improvements, to influence the neighborhood by his example, and to make his experiments known to the world by his agricultural treatises. At the same time, he founded an asylum for forsaken children. He also opened a school of theoretical and practical agriculture, and connected with it an institution for the education of the children of the higher classes. The establishment at Hofwyl acquired for its founder a very great reputation, and pupils hastened to it from all quarters. Many foreign princes visited it, and on their return to their own countries, founded similar institutions. In the year 1830, F. founded a school of art, and some years later, an infant school. He died 21st Nov., 1844. The institutions at Hofwyl were continued for some years by his son Wilhelm, and then entirely given up. Compare Hamm, *F.'s Leben und Wirken* (Bern, 1845).

FELLER, FRANCOIS XAVIER DE, 1735–1802; a Belgian Jesuit, educated at Rheims; professor of physical science at Luxemburg and Liege. In 1764, he was professor of theology at Tyrnau, Hungary; but in 1771, he returned to his professorship at Liege, remaining until the suppression of the Jesuits in 1773. He published *Catechism of Philosophy; Historical and Literary Dictionary; Course of Christian Morals and Religious Literature;* and *View of the Congress of Ems.*

FELLOW-COMMONER, a wealthy or married under-graduate of Cambridge, Eng., who pays extra to dine at the "commons" or fellows' table. At Oxford, they are called gentleman commoners.

FELLOWES, ROBERT, 1770–1847; b. England; graduated at Oxford; took holy orders in 1795; but soon afterwards left the established church, with whose doctrines he differed. His own views he gave in *Religion of the Universe*, 1836. Before this he had published *A Picture of Christian Philosophy; Religion without Cant; The Guide to Immortality; Manual of Piety adapted to the Wants and Calculated for the Improvement of all*

Sects of Christians; and *Body of Theology.* He was a liberal benefactor of the university of London.

FELLOWS, Sir CHARLES, an antiquary of considerable reputation, was b. at Nottingham in 1799. In the beginning of 1838, he commenced those travels in the east by means of which his name has been brought so prominently into public notice. His researches were chiefly confined to the western peninsula of Asia Minor, and to the course of the ancient Xanthus, in the s. of that peninsula. Commencing his investigations at Patara, at the mouth of the Xanthus, and proceeding inland along the valley of that river, he discovered, only 9 m. from the coast, the ruins of the city of Xanthus, formerly the capital of Lycia. Fourteen or fifteen miles higher up the river, he met with the ruins of another city, which, from inscriptions, he found to be the ancient Tlos. Having made drawings of some of the fine remains of architecture and sculpture which he found in the ruins of these cities, and copies of some of the inscriptions, F. returned to England, and published *A Journal written during an Excursion in Asia Minor, by Charles Fellows,* 1838 (Lond. 1839). In 1839, he again visited Lycia, and in the course of another excursion, he discovered the ruins of no less than 18 cities, each of which contained works of art. Another journal, entitled *An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor* (Lond. 1841), was the result of this journey. In 1841, an expedition left England for the purpose of selecting works of art from the ancient cities discovered by F., who accompanied the expedition, and directed its operations. Authorized by a firman from the sultan, they made their selections, and returned in the spring of 1842. Another expedition sent out by the trustees of the British museum brought home 20 cases of marbles and casts in 1844. These remains have been deposited in the British museum in what has been called the Lycian saloon. In 1845, F.'s labors were rewarded by the honor of knighthood. The other works of F. are—*The Xanthian Marbles: their Acquisition and Transmission to England* (1843); *An Account of the Ionic Trophy Monument Excavated at Xanthus* (1848); a reissue of his earlier journals under the title of *Travels and Researches in Asia Minor, particularly in the Province of Lycia* (1852); and *Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Relative Dates of the Lycian Monuments in the British Museum* (1855). He died in 1860.

FELLOWS, JOHN, 1733–1808; b. Conn. He served in the French war, and was a member of the provincial congress in 1775. After the conflict at Lexington, he led a regiment to Boston, and subsequently commanded a brigade in the battle of Long island, and was in the engagements at White Plains and Bemis Heights. His highest rank was brigadier-general.

FELLOWSHIP. See PARTNERSHIP.

FELLOWSHIP, IN A UNIVERSITY. As the history of this institution will be treated under UNIVERSITY, we shall here only mention its leading characteristics, as it exists in the two great universities of England—Oxford and Cambridge. In these ancient and celebrated seats of learning, the fellowships were either constituted by the original founders of the colleges to which they belong, or they have been since endowed. In almost all cases, their holders must have taken at least the first degree of bachelor of arts, or student in the civil law. One of the greatest changes introduced by the commissioners under the university act of 1854, was the throwing open of the fellowships to all members of the university of requisite standing, by removing the old restrictions by which many of them were confined to founder's kin, or to the inhabitants of certain dioceses, archdeaconries, or other districts. Fellowships vary greatly in value. Some of the best at Oxford, in good years, are said to reach £700, or even £800, whilst there are others which do not amount to £100, and many at Cambridge which fall short of that sum. Being paid out of the college revenues which arise from land, they also vary from year to year, though from this arrangement, on the other hand, their general value with reference to the value of commodities is preserved nearly unchangeable, which would not be the case if they consisted of a fixed payment in money. The senior fellowships are the most lucrative, a system of promotion being established among their holders; but they all confer on their holders the privilege of occupying apartments in the college, and generally, in addition, certain perquisites as to meals or commons. Many fellowships are tenable for life, but in general they are forfeited should the holder attain to certain preferments in the church or at the bar, and sometimes in the case of his succeeding to property above a certain amount. In general, also, they are forfeited by marriage, though this disability may now be removed by a special vote of the college, permitting the fellow to retain his fellowship notwithstanding his marriage. With the single exception of Downing college, Cambridge, in which the graduates of both universities are eligible, the fellowships are confined to the graduates of the university to which they belong.

FE'LO-DE-SE, in English law, is where a man, of the age of discretion, and *compos mentis,* voluntarily kills himself. "No man," says sir M. Hale (*Pl. of the Cr.* 411), "hath the absolute interest of himself, but 1*st*, God Almighty has an interest and propriety in him, and therefore self-murder is a sin against God; 2*d*, the king hath an interest in him, and therefore the injunction in case of self-murder is *felonicè et voluntariè se interficit et*

murderavit contra pacem domini regis." A man or woman is considered of full age in regard to capital offenses at the age of fourteen. A lunatic killing himself during a fit is not guilty of felo-de-se; but a merely melancholy and hypochondriacal temperament is not such a state of mind as will relieve a person from the consequences of this offense. Where two persons agree to die together, and in pursuance of this design one or both die, it is suicide, or felo-de-se. And in some cases, where one maliciously attempts to kill another, and unwittingly kills himself, this is said (Hawkins, P. C. c. 27, s. 4) to be felo-de-se. But as a general rule the act must be voluntary. Therefore, if death ensue from a rash act not intended to kill, as where a man cuts off his hand to prevent a gangrene, and the act is followed by death, this is not felo-de-se. Formerly, the law punished this offense by inflicting ignominy on the body of the offender, which was ordered to be buried by night at four cross-ways, and that a stake should be driven through the body. But by 4 Geo. IV. c. 52, this ignominious mode of burial is abolished, and it is provided that a felo-de-se shall be privately buried at night in a burial-ground. All the chattels, real and personal, of a felo-de-se are forfeited to the crown. In Scotland, the crime of self-murder is known as suicide (q.v.).

FEL'ON AND FEL'ONY. The etymology of the word felon has given rise to much difference of opinion. By the majority of the most reliable lexicographers, it is supposed to have a common root with *fail*, and its original signification was supposed to be a vassal who failed in his fidelity or allegiance to his superior, thus committing an offense by which he forfeited his fee or feud. From this it came to signify traitorous or rebellious, and was gradually generalized till it reached its popular meaning of a crime of so heinous a nature as to infer a capital punishment.

The characteristic distinction of a felony, in the opinion of all legal writers, is, that it is a crime which occasions the forfeiture of the offender's goods. "Felony," says Blackstone, "in the general acceptation of our English law, comprises every species of crime which occasioned at common law the forfeiture of lands and goods. Treason itself, says sir Edward Coke, was anciently comprised under the name of felony. . . . And not only all offenses now capital are in some degree or other felony, but...many other offenses not punishable with death, as suicide, manslaughter, and larceny, as they submit the committers of them to forfeitures." When a person is now convicted of felony, he does not forfeit any of his property; but he forfeits and is disqualified for any government or public office. The court may order him to pay all the costs incurred in procuring his conviction, as well as compensation to persons defrauded or injured by his felonious act. The crown may, during the sentence of imprisonment, or on the execution of the felon, appoint administrators to take possession of all his property, and hold it until the sentence expires, dealing with his affairs as if he were bankrupt, by paying his debts; and if there is a surplus, keeping or reassigning it for him or his heirs and representatives at the expiration of the sentence, 33 and 34 Vict. c. 23. Similar arrangements do not apply to Scotland.

FELSING, JAKOB, b. 1802; a German engraver, a pupil of his father and of the Milan academy. He was noted for the accuracy with which he reproduced the peculiar characteristics of paintings which he engraved, some of which were Correggio's "Marriage of St. Catherine," Carlo Dolci's "Christ on the Mount of Olives," Raphael's "Violin Player," and Overbeck's "Holy Family."

FELSPAR. See FELDSPAR, *ante*.

FELSTONE, a name introduced by prof. Sedgwick to designate those rocks which are composed, either in whole or to a large extent, of felspar. When they consist of a compact and apparently amorphous felspar, they are known as trachytes—a variety of this rock, which splits into small slabs, that ring with a metallic sound, is called phonolite. Trachyte, with distinct crystals of felspar scattered through it, becomes feltstone porphyry; when the rock is in a vitreous condition, and has a resinous luster, it is pitchstone. Even in the most compact felstones, minute crystals may be detected, and these sometimes increase in size, till we have varieties which are completely granular and crystalline.

FELT—FELTING, a fabric formed without weaving, by taking advantage of the natural tendency of the fibers of hair and wool to interlace with and cling to each other. The hatters' tradition concerning the invention of felt affords as good an illustration as any we can find of the principle of this manufacture. In most Roman Catholic countries, the hatters celebrate as a festival the 23d of November, St. Clement's day, as they formerly did in this country; and it is stated that St. Clement, when on a pilgrimage, put carded wool between his feet and the soles of his sandals, and found on his journey's end that the wool was converted into cloth. Although this tradition is very questionable, as the manufacture of felt is of far more ancient origin, there can be no doubt that if carded wool were thus continually trodden, and at the same time moistened, it would become felt, and all the manufacturer's processes of felting are but modifications of such treatment.

This matting or felting of the fibers of hair and wool results from their structure, for, when examined by the microscope, the hair of all animals is found to be more or less jagged or notched on its surface; in some animals it is distinctly barbed; and this

structure is so directed that the teeth or barbs all point towards the tip of the hair. See HAIR. If a piece of human hair (in which this structure is less marked than in most animals) be held between the finger and thumb, and rubbed in the direction of its length, it will invariably move between the fingers in the direction of its root; for the skin, while moving towards the tip of the hair, slides freely upon it, but moving in the other direction, against the inclination of the barbs, it brings the hair with it. It will be easily understood that when a number of hairs are pressed together, those which lie in opposite directions to each other and in contact will interlock at these barbs or teeth, and thus resist any effort to tear them asunder. When once this close contact and interlocking is established between any two or more hairs, they remain attached, but the others that are differently arranged, or not in contact, will still be free to move upon each other; and therefore, if subjected to continual blows, pushing, and pressure, like the treading of the feet in walking, the unattached hairs will be continually shifting until they reach others in suitable positions for clinging together, either by crossing obliquely or by lying in the same line, and overlapping at their ends or any other portion. When the hair has a natural tendency to curl, the felting is still more readily brought about by the additional interlacing. This is the case with wool to such an extent, that when free from grease it cannot be retained in the straight carded condition required for spinning and weaving. When it is required to be felted, the natural grease has to be removed. This tendency to felt is shown in the hard lumps formed in wool-mattresses that have been long used.

The beaver-hat maker produces his felt by taking a few ounces of the mixed fur, distributing it in an even layer by twanging a bowstring against the heap, and then condensing this into a felt by a sort of kneading process with his hands. See HAT.

The felt now extensively used for carpeting and other purposes is made by machinery, chiefly from the waste wool from the weaving-mills. Many patents have been taken out for the various details of felting machinery, but the main principle is the same in all. The wool is carded more or less perfectly, and steamed or moistened with hot water, and passed between beaters, which act like the pilgrim's feet in the manner already described. When used as drugget for covering carpets, or as a substitute for carpet, the felt is printed by means of blocks with various patterns, or simply dyed. Felt is also used for padding coats and other garments, sometimes for cloaks and capes; for table-covers, some of which are beautifully embossed and printed; for carriage linings, upholstery work, polishing cloths, pianoforte hammers, and various other purposes where a coarse or thick cloth is required. A simple kind of saddle, cut out of very thick felt, is in common use in South America.

The "felted sheathing" used as a non-conducting covering for retaining the heat in steam-boilers, is a substance intermediate between felt and paper, being composed of the commonest woolen refuse from paper mills, etc., made into a semi-pulp, and beaten to produce a partial felting. This when dried hardens, and though possessing but little tenacity, and unfit for the wear of friction, is, from its compactness, better adapted than ordinary felt for the purposes to which it is applied.

Asphalted roofing-felt is a very coarse felt saturated with pitch, asphalt, or coal-tar—usually the latter, on account of its cheapness; it is retailed at one penny per foot, and used for covering sheds and other buildings. A more expensive kind, free from coal-tar, is call *inodorous felt*, and used as a lining for damp walls upon which paper has to be hung. Asphalted felt is also used as a flooring for granaries and similar buildings, and has been recommended for public schools, to prevent the noise from the shuffling of the children's feet.

FELTON, CORNELIUS CONWAY, LL.D., 1807–62; b. Mass.; graduated at Harvard, 1827; and taught in Northampton, Mass., and at Geneseo, N. Y. In 1829, he was Latin tutor at Harvard; in 1830, Greek tutor; in 1832, he became Eliot professor of Greek; and in July, 1860, was inaugurated president. Among his publications were *Homer, with English Notes and Flaxman's Illustrations; Menzel's German Literature; Clouds of Aristophanes; Ancient Literature and Art; Poets and Poetry of Europe; Panegyricus of Isocrates; The Agamemnon of Æschylus;* and *Guyot's Earth and Man.* In 1853–54, he made a European tour; in 1855, he revised for publication Smith's *History of Greece,* with an edition of lord Carlisle's *Diary in Turkish and Greek Waters.* A selection from modern Greek writers was published by him. Other works of his were *Life of Gen. Eaton* in Spark's *American Biography;* addresses; and contributions to the *North American Review.* He was a member of the Massachusetts board of education, regent of the Smithsonian institution, and a member of the American academy of arts and sciences.

FELTRÉ, a t. of northern Italy, in the province of Belluno, is situated near the right bank of the Piave, 44 m. n.n.w. of Venice. It suffered severely from the attacks of the Goths in the 5th century. The chief buildings are the cathedral, the college, ecclesiastical seminary, and gymnasium. F. has some trade in corn, wine, and oil. Pop. 6,500.

FELTRE, MORTO DA, an Italian painter who lived about the close of the 15th and opening of the 16th century. At an early age he went to Rome and investigated the ancient, especially the subterranean remains, and thence to Pozzuoli, where he painted from the decorations of antique crypts or "grotte." The style of fanciful arabesque which he formed for himself from these studies gained the name of "grottesche,"

whence comes "grotesque;" not, indeed, that Morto was the first painter of arabesque in the Italian renaissance, for art of this kind had, apart from his influence, been fully developed, both in painting and in sculpture, towards 1480; but he may have powerfully aided its diffusion southward. His works were received with much favor in Rome. He afterwards went to Florence, and painted some fine grotesques in the Palazzo Pubblico. Returning to Venice towards 1505, he assisted Giorgione in painting the "Fondaco dei Tedeschi," and seems to have remained with him till 1511. If we may trust Ridolfi, Morto eloped with the mistress of Giorgione, whose grief at this transaction brought him to the grave. The allegation, however, is hardly reconcilable with other accounts. It may have been after 1511 that Morto returned to his native Feltre, then in a very ruinous condition from the ravages of war in 1509. There he executed various works, including some frescoes, still partly extant, and considered to be almost worthy of the hand of Raphael, in the loggia beside San Stefano. Towards the age of 45, Morto, unquiet and dissatisfied, abandoned painting and took to soldiering in the service of the Venetian republic. He was made captain of a troop of 200 men; and, fighting valorously, he died at Zara, in Dalmatia, in 1519, or perhaps somewhat later. One of his pictures is in the Berlin museum, an allegorical subject of Peace and War. (From *Ency. Brit.*, 9th ed.)

FELUCCA, a small class of vessel used in the Mediterranean. It is propelled by from 10 to 16 oars, and by lateen sails. It has frequently a rudder at each end, to be applied as occasion demands. During the French war, feluccas were armed with a heavy gun or two, and sent out as gun-boats against our ships, when becalmed near the Spanish ports; from their speed in smooth water, and the difficulty of hitting them, they were very troublesome antagonists.

FEMALE LABOR is prohibited in mines and collieries since 1st Mar., 1843 (5 and 6 Vict. c. 99), under heavy penalties. As to the limits under which it is permitted in factories, see FACTORY ACTS and WORKSHOP REGULATION ACT.

FEMALE SHERIFF. There is only one instance on record of the office of sheriff in England having been held by a female; this was in the case of Anne, countess of Pembroke. This lady, who was distinguished during the rebellion in the reigns of Charles I. and II. by her stanch adherence to the royal cause, was the wife of Philip, fourth earl of Pembroke, and daughter of the earl of Cumberland. On the death of her father, without male issue, in 1643, she succeeded to the hereditary office of sheriff of Westmoreland, and in that character she attended the judges of assize, and sat with them on the bench at Appleby.

FEMALE WHIPPING, as a public punishment, was abolished by 57 Geo. III. c. 75; and by 1 Geo. IV. c. 67, it was enacted that no female offender should suffer the punishment of being whipped either publicly or privately; but that imprisonment or solitary confinement should be substituted therefor. See WHIPPING.

FEME COVERTE (*fœmina viro co-operta*). In the language of the law of England, a woman by her marriage becomes subject to her husband, who has the control of her person, and is entitled to fix her residence. This control in the husband is admitted to a certain extent in criminal cases to excuse a married woman from guilt. Thus, in any felony, except murder or manslaughter, committed by a married woman, in presence of her husband, it is assumed that she acted under his compulsion. But this presumption may be rebutted by evidence that she was the principal agent in the crime. A married woman cannot, in criminal cases, be a witness for or against her husband, except when he is tried for violence against her. In civil cases, a married woman may be examined in a suit where her husband is a party. In a petition for divorce on the ground of adultery, a married woman is not a competent witness; but where cruelty forms one of the grounds of complaint, she may be examined on that subject. Her property is to a limited extent transferred to the husband. By 7 Will. IV. and 1 Vict. c. 26, even a will made before marriage is revoked by the marriage. But a deserted wife may, by 20 and 21 Vict. c. 85, s. 21, obtain an order to protect any money acquired by her own industry. By 33 and 34 Vict. c. 93 (1870) it is possible for a woman to retain her personal earnings, and gifts made to her during marriage in her own right (see HUSBAND AND WIFE). The landed property of a married woman is, during the marriage, under the administration of the husband, and during their joint lives, he is entitled to all the profits of the lands. Should there be a child of the marriage born alive, and capable of inheriting the lands, he has, by the courtesy of England (see COURTESY IN LAW), an estate for life in all lands in which he is seized in fee in her right. Formerly, a married woman could not, during marriage, execute a conveyance of lands without levying a fine (q.v.); but by 3 and 4 Will. IV. c. 74, a married woman may now make a disposition of real estate as if she were a *feme sole*. But the husband must concur in the deed, which must also be acknowledged by the wife, in presence of one of the judges, a master in chancery, or of a commissioner appointed under the act. Formerly, an action could not be maintained by a married woman unless with the concurrence and in the name of the husband. A married woman may now maintain an action and other remedies in her own name, as regards her separate estate. A married woman cannot bind her husband by any contract she may enter into, but as he is bound to support her, he

is liable for necessaries supplied to her while she lives with him, or if he willfully deserts her, but not where she has left him of her own accord. Formerly, a wife could not obtain a divorce from her husband; but by 20 and 21 Vict. c. 85, she may now obtain a divorce on the ground of adultery, coupled with cruelty or desertion. See DIVORCE. For the law of Scotland in regard to the rights of married women, see HUSBAND AND WIFE.

FEMERN, an island in the Prussian province of Schleswig-Holstein, taken from Denmark in 1864. It is separated from Holstein by a strait called the Femern sound, has an area of 70 sq.m., and a pop. of about 10,000. The island is flat, fruitful, and destitute of wood. Agriculture, fisheries, and stocking-weaving for exportation, form the principal employments of the inhabitants. The chief town is Burg, which has about 2,500 inhabitants.

FEMGERICHTE (derived from the old German *fem*, punishment, and *gericht*, court of justice), spoken of as the holy feme (or fehme), and also known as the Westphalian or secret tribunals, were among the most remarkable phenomena of the middle ages, and supplied the place of the regular administration of justice, then in a deplorable condition. The origin of these courts has been ascribed to Charlemagne, who, it was pretended, had instituted them to prevent the relapse into paganism of the Saxons who had been forcibly converted to Christianity. It is more probable, however, that they were a relic of the ancient German free courts of justice, the preservation of which may have been favored in Westphalia by special circumstances.

When Henry the Lion was put under the ban of the empire, and deprived of his possessions in 1179, Westphalia, which then comprised nearly the whole district between the Rhine and the Weser, was granted to the archbishop of Cologne; and from this time the secret tribunals gained in importance. In the general confusion which then prevailed in Germany, when all laws, both civil and ecclesiastical, had lost their authority, and the fabric of society seemed on the point of toppling into ruins, the F. were organized for the purpose of arresting and controlling the incipient anarchy that threatened to bring chaos back again, and of inspiring with feelings of salutary terror, through the agency of their mysterious powers and solemn judgments, all rapacious and lawless persons (but especially the feudal barons) who—on account of the impotence of the ordinary legal checks—committed crimes with impunity. In the causes, therefore, which led to their formation, and in their general design, the F. resemble the Hanseatic towns. They soon acquired tremendous influence, the emperors themselves having recourse to their assistance against powerful and rebellious nobles. It was in the 14th and 15th centuries, however, that they attained the summit of their dread authority, when they began to extend themselves over the whole of Germany. Beneficial as in many instances the proved to be, they could not fail, in the long-run, to degenerate, and to be frequently employed as a cloak to self-interest and malice. It is therefore by no means surprising that many voices were raised against them, and that in 1461 various princes and cities of Germany, as well as the Swiss confederates, formed unions for affording justice to every individual, and preventing any from seeking it from the secret tribunals. Particular classes likewise obtained imperial letters of protection against the pretensions of these tribunals. The emperors themselves, however, could go no further than to make some unavailing attempts to introduce improvements into the constitution of the F., as the latter were bold enough to oppose the imperial authority, and even summoned the emperor Friedrich III. to appear before them. Their influence came to an end only when the public peace (*landfriede*) was established in Germany, and an amended form of trial and penal judicature was introduced. The last real F. was held at Celle in Hanover, in the year 1568. A remnant of the institution, however, existed in Westphalia until the year 1811, at which time it was performing the function of a society for the suppression of vice, when it was abolished by an order of Jerome Bonaparte. Beyond the limits of Westphalia, notwithstanding all their endeavors, the F. never succeeded in fully establishing their authority; and even in the *Red Land*, as Westphalia was called (probably from the color of the soil), they were restricted by the imperial privileges on which they founded their authority.

The members of the feme were called *wissende*, "the knowing ones," or the *initiated*. It was necessary that they should be born in wedlock, be of the Christian religion, lead a blameless life, and bind themselves by a tremendous oath "to support the holy feme, and to conceal it from wife and child, father and mother, sister and brother, fire and wind, from all that the sun shines on and the rain wets, and from all that is between heaven and earth." Originally, none but an inhabitant of the "Red Land," possessed of real property, could be admitted a member of the wissende; at a later period, this rule was relaxed. From the general body were elected officers called *freischöffen* (free justices), who were assessors of the court and executors of its sentences. The presiding judge was called the *freigraf* (free count). The general superintendence and presidency of the secret tribunals belonged to the lord of the land, i.e., in Westphalia, to the archbishop of Cologne. The highest office, however, as supreme president, was nominally held by the emperor, who was usually elected into the number of the wissende on the occasion of his coronation at Aix-la-Chapelle. The court of a freigraf was called *freiding* (a free court of justice), and the place where he held court a *freistuhl* (free bench or court).

One of the most celebrated free courts had its seat at Dortmund. The sittings of the tribunal were either open or secret. The former were held by day in the open air, and decided in civil disputes: the secret tribunals took cognizance of those who had been unable to prove their innocence in the open courts, as well as of those who were accused of heresy, sorcery, rape, theft, robbery, or murder. The accusation was made by one of the freischöffen, who declared, upon oath, that the accused had committed the crime. The citation was secretly affixed, with symbolical signs, to the door of the accused, who was to meet the wissende at a certain hour and place, and be conducted by them before the tribunal. The accused could now clear himself by an oath, but the accuser and witnesses could oppose this with another. If the accused could now bring forward six witnesses to swear in his favor, the accuser could strengthen his oath with 14 witnesses; and it was not till after 21 witnesses had made their affidavit in his favor that sentence of acquittal necessarily followed. The persons convicted, as well as those who refused to obey the summons, were given over to the freischöffen. The first freischöffe who met him was bound to hang him on a tree, or, if he made any resistance, to put him otherwise to death. A knife was left by the corpse, to show that it was not a murder, but a punishment inflicted by one of the freischöffen. Compare Wigand, *Das Fehmgericht Westfalen's* (Hamm. 1825), and Usener, *Die Frei- und heimlichen Gerichte Westfalen's* (Frankfort, 1832); Geisberg, *Die Fehme* (1858).

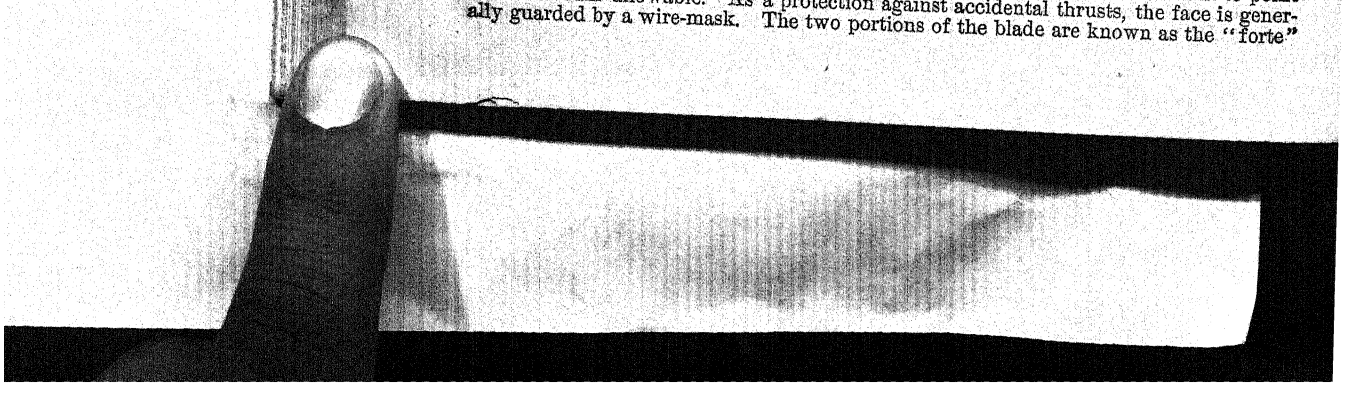
FE'MUR, the thigh-bone in human anatomy. In general terms, it consists of a shaft very slightly curved, and two extremities. The upper extremity bears two projections, called the greater and lesser *trochanters*, for the attachment of muscles, and a short *neck*, nearly at right angles to the shaft, terminated by a hemispherical *head*, which being received into a cavity of the pelvis called the acetabulum, forms the hip-joint, a ball-and-socket joint. The lower extremity of the femur has on each side an enlargement called a *condyle*, or knuckle. The articular surface of the condyles is hemicylindrical, as also is the somewhat depressed space between them, called the *trochela*, and with the large bone of the leg, called the *tibia*, forms a hinge joint. The femur is attached to the pelvis by two ligaments—a capsular ligament, which incloses the head and neck, and the *ligamentum teres*, a sharp ligament which joins the head with the bottom of the acetabulum. It is attached to the tibia by several ligaments, placed in different positions, to combine strength with freedom of motion, the most important of which are the lateral ligaments and the crucial ligaments. The crucial ligaments cross from one member of the joint to the other in oblique directions. Powerful extensor and flexor muscles, besides performing their ordinary functions, aid in keeping the parts in opposition. The femur has a wide range of distribution in the animal kingdom, and is not the exclusive property of warm-blooded animals. In man, it is the strongest, longest, and largest bone. In the whale, it is only rudimentary. In fishes, it is not represented, but has a varying importance in mammals, birds, reptiles, and amphibians. It is a short bone in the ruminants and horse family. In the tortoises, the curve is considerable, while it is almost straight in carnivora, bats, etc. In many reptiles it is slightly rudimentary.

FENCES, in agriculture, serve the twofold purpose of inclosing animals on pasture-grounds, and of protecting land from straying animals. They are formed of a great variety of materials, and of very different structure. In countries where wood or stones are scarce, more especially where they have been long settled, hedges, formed of various kinds of plants, are common. These, when well kept and managed, give a clothed and picturesque appearance to the landscape. The hawthorn is the favorite hedge-plant in this country. See HEDGES.

When stones are used as F., they are built as walls. The form and mode of building varies with the nature and quality of the stones, and the degree of taste and nicety required. Aberdeenshire forms it walls or dikes surrounding its fields with the granite boulders that are strewed over the surface of the country. The graywacke affords slaty stones, which give the walls their peculiar form in other parts, and so with the various kinds of sandstone.

In new countries, where wood is abundant, the F. are all of this material. The snake-fence, named from its zigzag form, is made by merely laying the ends of trees above each other, and requires no other means of fixing. As wood becomes more valuable, it is made into stobs and rails. The stobs are driven into the ground from two to three yards apart, and from four to five rails are nailed across, according to the purpose it is meant to serve. The stob and rafter fence is made by driving the stobs from 3 to 4 in. apart, and binding the whole by a rafter or rail nailed across the top. This is one of the strongest of wooden F., but requires more material than the other.

Iron or wire fencing has come much into use of late. Vast stretches of waste land in this country, as well as pastures in Australia, have been inclosed by means of wire-fencing. Strong wires are stretched on posts firmly secured in the ground, from 100 to 200 yards or more apart. Intermediate or lighter posts are put in at from two to three yards' distance. After the wires are fully stretched, they are fixed to the smaller posts; when of wood, by means of staples, or threaded through when of iron.



Law regarding Fences.—In England, it is held to be the duty of the occupier of lands to repair and uphold F., and not of the landlord; and without any special agreement, the landlord may maintain an action against the tenant for not doing so. Though a

tenant from year to year is not bound to put the F. and other buildings on his farm into repair, he must not do anything that amounts to waste, or to a breach of the rules of good husbandry. He cannot cut and sell hedgerows, or if he does so, he must make up the hedges and F. according to the course of good husbandry. "If there be a quick-set fence of white thorn, and the tenant shut it up, or suffer it to be destroyed, this is destruction; but cutting up quicksets is not waste, for it preserves the spring."—Woodfall *On Landlord and Tenant*, pp. 456, 457, and cases cited. Where, in answer to a declaration against a tenant for not using premises in a husbandlike manner in repairing F., on his implied obligation to do so, the tenant pleaded that the fence became out of repair by natural decay, and that there was no proper wood which he had a right to cut for repairing the F., and that the plaintiff ought to have set out proper wood for the purpose of repairs, which he had neglected to do, the plea was held to be bad, because it did not aver any request to the plaintiff so to do, or a custom of the country in that respect.—Whitefield *vs.* Weedon, 2 Chit. 685. By 7 and 8 Geo. IV. c. 29, ss. 23, 40, 44, the destruction of F. is declared to be punishable summarily with a fine of not more than £5; or in the case of a deer-park fence, with £50. The statute is limited to England.

In Scotland, the landlord is held bound to put the fences on the farm in due repair on the entry of the tenant, independently of any stipulatian in the lease; whilst the tenant must maintain them and leave them, with the exception of ordinary tear and wear, in the state in which they were given over to him. But the landlord is not entitled to increase the burdens of his tenant by erecting new fences not stipulated for, unless they be march-fences, which he may be compelled to erect by contiguous proprietors, and half the expense of which he must share with them, under the act 1661, c. 41, ratified by 1685, c. 39, of the existence of which the tenant is presumed to have been aware when he entered to the farm. As regards fences erected spontaneously by the tenant, the rule is that if, being entitled to remove them, he allows them to remain, he must leave them in repair; but if they are fixtures (q.v.), which he is not entitled to remove, he is not bound to repair them. It is optional to the landlord, at the termination of the lease, to order removal of fences and other buildings voluntarily built by the tenant, except in the case of palings and movable fences, or to prevent their being removed without offering any indemnification.—Hunter, *Landlord and Tenant*, ii. p. 208. As buildings, fences, and other ameliorations made by the tenant, are supposed to be made for his own sake, and not for the sake of the landlord, he has no claim for the moneys which he may have expended for such purposes, at the end of the lease; except under a special stipulation to that effect. But if the tenant's occupation be terminated abruptly, and more particularly if his lease excludes assignees and sub-tenants, it is equitable that the landlord, getting the benefit beyond what was contemplated by the tenant, the family or the creditors of the latter should be allowed a proportion of the value of the ameliorations. Bell's *Princip.* s. 1255. The cases in which meliorations are or are not removable will be explained under fixtures (q.v.). For the law as to fences in regard to trespassing, see TRESPASS.

FENCIBLE, a word, of doubtful origin, meaning defensive. Regiments raised for local defense, or at—and only for—a special crisis, used to be denominated "fencible." In the last French war, the local, as distinguished from the general militia, was called fencible, and many of the volunteer corps styled themselves the "royal ——shire fencible infantry." The only regiment of this character still bearing the title is the "royal Malta fencible artillery."

FENCING may be described, for a general definition, as the art of defending one's own body or assailing another person's in fair fight by the aid of a side-weapon—i.e., by a sword, rapier, or bayonet. Technically, F. is usually limited to the second of these; and works on the art touch only on attack and defense with the foil in pastime, and the rapier in actual personal combat. The present opportunity will, however, be taken to introduce the elements of single combat with foil, sword, and bayonet. The objection formerly existed that instruction in F. encouraged a propensity to dueling; but as that absurdest of absurd customs has entirely ceased—at least in Britain—to demand its annual victims, no such objection now holds. F. may therefore be safely learned and taught as an elegant and manly accomplishment, developing gracefulness and activity, while it imparts suppleness to the limbs, strength to the muscles, and quickness to the eye. This regards F. with the foils (the rapier has disappeared with the duels which employed it); but instruction in F. with the sword and bayonet, while conferring the same advantages, has in addition the recommendation of helping to fit the student for taking an active part in any general national defense that political circumstances might render necessary. The foil (q.v.) is a circular or polygonal bar of pliable and very highly tempered steel, mounted as any other sword, and blunted at the point by a "button," to prevent danger in its use. From its nature, the foil can only be employed in thrusting, and, being edgeless, it can be handled without liability to cutting wounds. The length of the blade should be proportioned to the height of the person using it—31 in. being the medium length for men, and 38 in. from hilt to point the maximum allowable. As a protection against accidental thrusts, the face is generally guarded by a wire-mask. The two portions of the blade are known as the "forte"

and the "feeble;" the first extending from the hilt to the center, and the other from the center to the point.

In drawing, advance the right foot slightly to the front, take the scabbard with the left hand, raise the right elbow as high as the shoulder, seize the hilt with right hand, nails turned inward, and having drawn the foil, pass it with vicacity over the head in a semicircle, and bring it down to the guard (of which presenly) with its point towards the adversary, not higher than his face, nor lower than his lowest rib. Simultaneously with the weapon being brought into position, the left hand with fingers extended should be raised to a level with the head, as a counterpoise in the various motions to ensue. In establishing the position of guard, the right foot must be advanced 24 in. before the left, the heels in a straight line, and each knee slightly bent, to impart elasticity to the movements, but not too much, lest the firmness of the position be diminished.

In F., there are three openings or entrances—the *inside*, compromising the whole breast from shoulder to shoulder; *outside*, attackable by all the thrusts made above the wrist on the outside of the sword; and the *low parts*, embracing from the armpits to the hips. For reaching and guarding these entrances, there are five positions of the wrist—prime, seconde, tierce, carte (quarte), and quinte. The most important, and those to commence with, are carte and tierce, from which are derived the subordinate positions of carte over the arm, low carte, and flanconnade or octave.

To engage is to cross swords with your adversary, pressing against his with sufficient force to prevent any maneuver taking you unawares. To disengage is to slip the point of your sword briskly under his blade, and to raise it again on the other side, pressing in a direction opposite to that of the previous case.

The guard in each position is a passive obstruction to the opposing thrust; the parade is an active obstruction, in which the guard is first assumed, and the blade then pressed outward or inward by a turn of the wrist against the adversary's sword, so that when thrust at your body it shall be diverted from its aim, and held off. The parade may therefore be regarded as a mere extension of the guard. If the parade were called the "parry," it would convey its meaning more readily to English ears. Another, and perhaps more appropriate name for thrust, is the "lunge" or "longe," as the thrust is almost always accompanied by a lunge forward of the right foot, to give at once greater force and longer command to the blow.

The following are directions for the principal guards and thrusts.

Carte, Guard.—Turn wrist with nails upwards; hand on a line with lower part of breast; arm somewhat bent, and elbow inclined a little to the outside; point of foil elevated at an angle of about 15°, and directed at upper part of adversary's breast.

Thrust.—Being at the guard in carte, straighten the arm, raise the wrist above the head, drop the foil's point to a line with the adversary's breast, throw first the wrist, and then the whole body, forward by a lunge of the right foot of 2 ft. from the "guard," the left foot remaining firm. The left hand should be dropped during the lunge to a level with the thigh, and to a position distant about a foot from the body; it will then afford a good counterpoise to the sword-arm. During the whole action, the body must be perfectly upright. When performed briskly, it appears that the point and foot are advanced simultaneously, but in fact the point has, or should have, priority, in order that the instantly following lunge may drive it home. Most of these observations concerning thrust in *carte* apply equally to all other thrusts.

Carte over the arm is a variety of this thrust. The sword is driven outside the adversary's blade, from the carte position, but in the tierce line.

Low Carte.—Engage adversary's blade in carte, then drop point under his wrist, in a line to his elbow, and thrust at his flank, the body being considerably bent.

Flanconnade or Octave.—Engage adversary's blade in carte, and bind it with yours, then carry your point behind his wrist and under his elbow: without quitting his blade, plunge your point to his flank.

Tierce, Guard.—As in carte, the nails and wrist being somewhat more downward, and the arm stretched a little outward, to cover the outside.

Parade.—Move arm, from the guard, obliquely downward to the right about 6 in., and oppose the inside of the adversary's blade.

Thrust.—From the guard, turn wrist with nails downward, the same height as in carte, the inside of the arm in a line with the right temple; then thrust and lunge as in carte.

Seconde, Parade.—Nails and wrist downward, hand opposed outward, and blade, pointing low, should form an angle of about 45° with the ground.

Thrust.—The same as tierce, but delivered under the adversary's wrist and elbow, to a point between his right armpit and right breast: the body to be more bent than in carte or tierce.

Prime, Parade.—In using prime to parry the thrust in seconde, pass your point over the adversary's blade, lower it to the waist, keeping your wrist as high as your mouth, nails downward, elbow bent, and body held back as far as possible. The left foot should also be drawn backward a few inches, to remove the body further from the hostile point.

Thrust.—An extension movement from the parade.

Quinte, Parade.—Wrist in high carte, sword-point low, and oppose adversary from the forte of the outside edge of your blade.

Thrust.—Make a feint on the half-circle parade, with the wrist in carte; disengage your point over the adversary's blade, and thrust directly at his flank.

Half-circle, Parade.—One of the principal defensive parades: straighten arm, keep wrist in line with shoulder, nails up: by quick motion of wrist sweep point from right to left in a circle covering your body from head to knee, until the adversary's blade is found and opposition established.

The parades parry thrusts as follows:

Carte, with wrist low, parries low carte and seconde; with wrist raised, all the thrusts over the point on the inside of the sword and the flanconnade.

Tierce parries high carte; with raised wrist, parries tierce.

Seconde parries all lower thrusts, both inside and outside.

Half-circle parries carte, high carte, tierce, and seconde.

Prime parries carte, low carte, and seconde.

Quinte parries seconde and flanconnade.

In all parades or parries, care must be taken that in covering the side attacked, the parade is not so wide as to expose the other side to the enemy. A steady countenance, showing no disquietude at any attempt he may make, is, above all, necessary in parades.

Every parade has its return, which should be made with vivacity and decision. A thrust can be returned when the adversary thrusts, or when, baffled in his attack, he is recovering to his guard. In the first case, no lunge is necessary, the return being made from the wrist: this return requires great skill and quickness, since the adversary should receive the thrust before, by finishing his own, he has touched your body.

Ordinary Returns.—After carte parry, return in carte; after tierce, return in tierce; after parrying high carte, return seconde; after parrying seconde, return in quinte; after parade in prime, return seconde or low carte.

Feints, of which there are many varieties, consist in threatening an attack on one side of the sword, and then executing it on the other. The best parade against a feint is that of the half-circle, which will be sure to find the adversary's point.

Advance and Retreat are motions of attack or withdrawal, performed by advancing the right, or withdrawing the left foot suddenly about 18 in., and instantly following it with the other foot. As the adversary advances, you must retreat, unless prepared to receive him at the sword-point.

Salute.—The salute is a courteous opening of the fencing, and consists in gracefully taking off the hat, while, with the foils, your adversary and yourself measure your respective distances.

Appels or beats with the right foot, *beats* on the adversary's blade, and *glissades* or glidings of one sword along the other, are motions intended to confuse the enemy, and give openings for thrusts.

Voltes, *demi-voltes*, and *disarming*, were maneuvers formerly taught with care, but they are now quite discarded in the academies of England and France, as useless and undesirable.

In Spain and Italy, considerable differences of practice from that in France and England prevail. The left hand is used as an auxiliary in parrying, and in Italy is aided by a dagger, or sometimes a cloak. The Spaniard, though trusting to his sword and left hand only, has his blade 5 ft. long, with sharp edges; his guard is nearly straight, and one of his favorite attacks is by a *cut* (not thrust) at the head.

In an article limited in length as this must necessarily be, it is impossible to give more than the merest outline of the various motions; but, of course, in actual practice, there are endless variations of the different modes of attack and defense, which will be severally adopted according to the skill and option of the fencer. There is no finer indoor exercise than F., as the muscles in every limb are developed and strengthened by it. The great requirements for success are a steady eye and hand, a quick purpose as quickly executed, and perhaps, above all, perfect equanimity of temper.

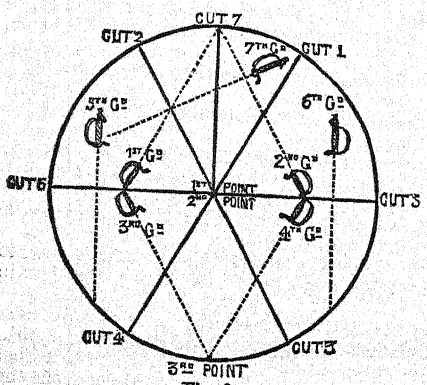


Fig. 6.

The Sword Exercise differs from F. with the foil; in that, the weapon employed has one cutting edge as well as a point, and is therefore intended to cut and thrust. The sword is the arm of all officers in the army and navy, of many non-commissioned officers, and constitutes the sole mode of attack and defense for the officers of the British volunteers. A certain degree of proficiency in its use is therefore always serviceable. In practice, the usual substitute is a stout, straight stick, called a "single-stick," having a basket-handle to protect the knuckles.

The position of the combatant is the same as that assumed in F. with the foil; the lunge is similar, as are also the "advance" and "retreat," and other minor points. According to the instructions of drill masters, there are seven cuts, with seven corresponding guards, and three thrusts. The theoretical directions of all these are shown on the accompanying diagram, which represents a target placed opposite a pupil, so that he may see the motions he is expected to perform displayed before him. The center of the target is supposed to be in a line with the center of his breast.

The cuts proceed from the circumference towards the center along the *thick* lines. Nos. 1, 3, and 5 are inside cuts, and attack the left cheek, left side, and inside of the right leg respectively; 2, 4, and 6 are outside cuts, attacking the enemy's right cheek, right side, and right leg on the outside. No. 7 is a vertical cut, aimed at the head.

The dotted lines show the position of the sword in the several guards by which the cuts are opposed. The sword-handles illustrate the situation of the right hand with reference to the center of the body.

The points or thrusts are shown by the black circles. That towards No. 1 should be directed with the wrist and edge of the sword upwards to the right; towards 2, with the edge upwards to the left; and in the 3d point, with the wrist rising to the center, and the edge upwards to the right.

The "parry" is an additional defensive movement, and consists in bringing the wrist nearly to the right shoulder; whence, as center, a circular sweep of the sword is made from left to right.

A considerable latitude is allowable in regard to the cuts, as to the part of the adversary's body at which they are directed, provided the general inclination of the blow be observed; similarly, the cut may at times be parried by a guard other than that intended specially for it, according to the discretion of the fencer.

In engaging, or joining swords, with the enemy, press the blades but lightly together, so that the hand and wrist may be readily susceptible of any motion. In making the guards, care must always be taken to receive, if possible, the feeble of the enemy's blade on the forte of your own, so as to offer the greater opposition. It should also be borne in mind that, in all cuts at the leg, when at proper distance, the shifting of your own leg, and delivering a cut at the same moment, becomes the most effectual and advantageous defense, particularly if you happen to be taller than your adversary, as you will then probably be out of his reach, while he is within yours.

In contending with bayonet or pike, the most effectual guard is the 5th, which, if well timed, enables the swordsman to seize the musket or pike with his left hand, and then make the 6th cut at his opponent's neck. In an encounter with the rapier, the best cuts are Nos. 3 and 4, as they attack the enemy's arm, which must be advanced within reach before he can touch your body, and also constitute a defense against his thrust. If the enemy—no matter how armed—be on horseback, the dismounted swordsman (provided he have proper nerve and agility) has decidedly the advantage. Endeavor to place yourself on his left, where he has less power of defending himself or his horse, and cannot reach to so great a distance as on his right: an attack on the horse will probably render it ungovernable, and it becomes easy then to avoid the rider's blows, while he himself may be attacked with impunity in almost any direction.

Bayonet Exercise.—If the sword exercise be of use to volunteer officers, there are thirty times as many volunteers themselves to whom a proper command of the bayonet is indispensable. In close-quarter engagements, there is no weapon more formidable: from its length and weight, the thrust of the bayonet gives a terrible wound, and its force is such that there is great difficulty in parrying the attack. Like other small arms, it is most serviceable when handled on scientific principles; and the art of using it to advantage is so simple as to be very easily acquired, while the exercise, from the weight of the rifle, admirably aids in developing the muscles of all parts of the body.

Of course, the bayonet is always fixed at the end of the musket, when it becomes virtually a pike. The position of the feet in the bayonet exercise remains always the same relatively, and absolutely until advance or retreat be effected. The right foot is thrown back 24 in., and the weight of the body thrown upon it. The heels are kept in a line with each other, both knees bent and well apart; the right knee directly over the foot, the left easy and flexible, pointing to the front. In this position of the body, all the defensive motions of the bayonet are made. In "guard," the bayonet is brought nearly to a horizontal direction, level with the waist, and pointing towards the breast of an advancing enemy. Similarly, to "guard," the positions "low," "high," and "second point" are assumed. The butt of the rifle is always kept well to the right side, the hand behind the trigger-guard, and the whole body in attitude to offer great resistance. In "low," the barrel is turned downwards; but in all the other defensive motions it is held upwards. The position of the arms is in each case that which would naturally be taken in placing the bayonet and musket in the required direction.

The offensive position of the body is acquired by the extension of the right leg, and bending forward of the left without moving the feet. The butt of the rifle is at the same time pressed firmly to the shoulder. This position is called "point," and constitutes an extension of the weapon in a direction parallel with either of those previously taken. As there were four "guards," so there are four points. The barrel is in each case upward, and the motions for each are similar, except in pointing from "2d point,"

when the rifle, seized by the right hand round the small of the butt, is thrust straight up above the head to the full extent of the arm, the left hand falling along the thigh, and the legs being straightened so as to form an isosceles triangle.

"Shorten arms" is a useful motion, both as a defense and as a preparation for a strong attack. It consists in carrying the butt back to the full extent of the right arm, while the barrel (downwards) rests upon the thick part of the left arm. The body is thrown upon the right leg, and the left straightened.

In all the guards and points, and also "shorten arms," the bayonet may be turned directly to the front, to the right, or to the left, as circumstances may suggest. In contending with a swordsman, the action of changing from right to left, when at the "high" or "low," is sufficient defense against the ordinary cuts of the latter.

Among the treatises consulted for this article have been the works on F. by Angelo and Roland, as well as the shorter instructions issued by the military authorities.

FENELON, Francis de Salignac de la Mothe, was b. Aug. 6, 1651, in the château Fenelon, province of Perigord, now included in the department of the Dordogne, of a family which has given many celebrities both to the church and to the state in France. His education was conducted at home up to his 12th year, when he was transferred to Cahors, and afterwards to the Plessis college in Paris. At the close of a most blameless collegiate career, he selected the church as his profession, and entered, in his 20th year, the newly founded seminary of St. Sulpice, then under the direction of the celebrated abbé Tronson, where he received holy orders in 1675. Unlike but too many ecclesiastics of his own rank at that period, he gave his whole heart to his sacred calling. For some time after his ordination, he was employed in attendance at the hospitals, and in other parochial duties of the parish of St. Sulpice; and in the year 1678, he was named director of an institution recently founded for the reception of female converts to the Roman Catholic faith, in Paris. During his tenure of this office, he wrote his first work, *On the Education of Girls,* which is still a standard authority; and the gentleness, moderation, and charity with which he discharged his duties towards the young converts, led to his appointment as head of a mission, which, on the revocation of the edict of Nantes in 1685, was sent to preach among the Protestant population of Saintonge and Poitou. In 1688, he resumed his duties in the Maison des Nouvelles Converties, at Paris; and in the following year, he was named by Louis XIV. to the highly confidential post of preceptor of his grandson, the young duke of Burgundy. F.'s management of this most important and delicate trust showed how well he understood the true nature and objects of education. All his own instructions, and all the exercises enjoined upon his pupil, were so contrived, as, while they imparted the actual knowledge which it is the ordinary business of a master to communicate, at the same time served to prepare the mind and the heart of the pupil for what was to be the real business of his life, by impressing upon him a sense of the responsibility which awaited him, of the great principles of truth and justice upon which these responsibilities are founded, and of the hollowness and futility of all earthly glory, power, and happiness, which do not rest upon this foundation. To this wise design of the preceptor we are indebted for many works still popular in educational use; for the *Fables;* for the *Dialogues of the Dead;* for the *History of the Ancient Philosophers;* for the germ at least of the *Telemachus;* and for the *Life of Charlemagne;* the manuscript of which last work, unfortunately, was burned in the fire which destroyed the archiepiscopal palace of Cambray in the year 1697. As an acknowledgment of these great merits, he was presented by the king, in 1694, to the abbey of St. Valery, and in the following year, to the archbishopric of Cambray, which he only accepted on the express condition that for 9 months of each year he should be exempted from all duties as preceptor of the prince, and left at liberty to devote himself exclusively to the care of his diocese. It is to this period of F.'s life that the history of the unhappy controversy about quietism belongs. Without entering into the details of this singular revival of the ancient mysticism (see Mysticism), it will be enough to say that two separate schools of quietism are to be distinguished, the moral character, or at least the moral tendency, of which was exceedingly different. See Quietism. In one of these, the common mystic principle of the absorption of the soul in the love and contemplation of God, led to the conclusion that the soul, in this state of absorption, became entirely passive; that it was thenceforth independent of the external world; that it suffered no contamination from the material actions of the outer man, and that no acts of virtue, not even of prayer, were any longer required. See Molinos. The other school, while it maintained the theory of passive contemplation and love, yet repudiated the dangerous and immoral consequences which were deduced therefrom. It was exclusively the latter and less objectionable form of quietism, the professors of which for a time claimed, although not the patronage, yet at least the indulgent consideration of Fenelon. He formed, in the year 1687, the acquaintance of the celebrated Madame Guyon, who may be regarded as the foundress of the French school of quietism. See Guyon. The extraordinary piety and exemplary life of this remarkable woman, and his own natural bias towards the tender and lofty spirituality which she professed, appear to have blinded F. to the true nature and to the practical consequences of the system which she followed. Fully convinced of the unfairness of much of the outcry which was raised against her, and which made her responsible for all the principles of

the grosser quietism of Molinos, his generous mind was perhaps attracted to her cause by the very injustice of her opponents. He advised her to submit her works to the judgment of Bossuet, who was then in the zenith of his fame, and with whom F. was in the most friendly relations. In the condemnation of the book of Madame Guyon by this prelate, F. acquiesced; but as she made a formal submission to the church, he refused to join in any condemnation of herself personally. Nevertheless, when a commission was appointed to examine the whole affair, F., although not a member, took a part in the proceedings; and he even suggested certain changes in their report, which he subscribed in common with the rest. To the articles prescribed for her signature by this commission, Madame Guyon readily subscribed; but it was further considered necessary not only to publish a condemnation of her several works, but also to prepare a special exposition of the true doctrine of the church on these questions. When the work of Bossuet on this subject was completed, he submitted it to F. for his approval. This F. not only refused to give, but even composed his own *Maxims of the Saints in the Interior Life*, in explanation and defense of certain at least of Madame Guyon's doctrines. He submitted his book to the archbishop of Paris, and introduced into it some modifications which were suggested by the diocesan censors, cheerfully agreeing to the stipulation of the archbishop, that it should be kept back from publication until the completion of the rival treatise of Bossuet, *On the States of Prayer*. An unfortunate violation of this engagement, committed without the knowledge, and in the absence of F., was the last of a long train of causes which led to the painful and disedifying rupture between these two great prelates. F.'s book was received with much clamor, that of Bossuet was universally approved; and in the controversy which ensued, all the weight of the displeasure of the court, which F. had provoked by the covert strictures upon the existing state of things, in which he was believed to have indulged in his works of fiction, was brought to bear against him. He was ordered to submit his book to the judgment of an ecclesiastical tribunal, of which Bossuet was a member. F. refused to accept Bossuet as judge, on the ground that he had already prejudged the cause; and in the end he appealed to the judgment of the Holy See. Unfortunately, even while the affair was pending at Rome, the controversy was still maintained in France. Bossuet published a succession of pamphlets. Several of the bishops who had espoused the side of Bossuet, issued pastorals in the same sense. F. defended himself vigorously against them all in several publications, explanatory as well of his principles as of the personal imputations in which some of his adversaries did not scruple to indulge. The last blow against the ancient friendship of the great rivals was struck by Bossuet in his celebrated *Relation sur le Quiétisme*. F. was wounded to the heart. The copy of Bossuet's pamphlet which first came into his hands is still preserved in the British museum; and the margin is literally filled with remarks, annotations, replies, denials, and rejoinders, in the singularly delicate and beautiful handwriting of the indignant archbishop. The copy now in the British museum is most probably one which, as we learn from his correspondence, he sent to his agent at Rome, and on the margin of which he corrected, for the guidance of his friend, the many false and exaggerated charges of his great antagonist. The substance of these replies he gave to the public in a most masterly defense, written, printed, and published within little more than a fortnight from the appearance of Bossuet's *Relation*. From this point, the controversy assumed a more personal, and therefore a more acrimonious character; and it was maintained on both sides till the long delayed decision of the pope brought it to a close, Mar. 12, 1699, by a brief, in the usual form, condemning the *Maxims of the Saints*, and marking with especial censure 23 propositions extracted from it. The conduct of F. under this blow constitutes, in the eyes of his fellow-churchmen, one of his highest titles to glory. He not only accepted, without hesitation, the decision of Rome, but he took the very earliest occasion to publish from his own pulpit the brief of his condemnation; he issued a pastoral address to his flock, to apprise them of the judgment of Rome, and of his own cheerful acquiescence; and he presented to his cathedral a magnificent piece of church-plate, a gold ostensory, in which the angel of truth is represented trampling under foot many erroneous works, the most prominent of which bears the title of *Maxims of the Saints!* Bossuet is said to have been greatly touched by the conduct of his noble adversary, and to have earnestly desired a reconciliation. But the adverse influence of the king, Louis XIV., and of the court stood in the way. The jealousy with which the political principles of F. were already regarded was heightened about this time into open hostility by the appearance of his *Telemachus*, which was printed from a copy surreptitiously obtained by his servant, and which the king regarded as but a masked satire upon his own court: Sesostris being supposed to represent the Grand Monarque himself; Calypso, Madame de Montespan; Protesilaus, Louvois; and Eucharis, Mademoiselle de Fontanges. Louis's anger knew no bounds. F. was strictly restrained within his diocese; measures were taken to give the condemnation of his book every character of publicity; and what wounded him most of all, all intercourse with him, whether personal or by letter, was forbidden to his old and much-loved pupil, the duke of Burgundy. From this date, F. lived exclusively for his flock. He founded at Cambray a seminary for his archdiocese, which he made his own especial charge. He was assiduous in preaching, and in the discharge of the other duties of his office; and the fame of his benevolence, charity, and enlightened liberality is attested

by the order given in the campaign of 1709 to spare the palace and the stores of the archbishop of Cambray. The only later controversy in which he appears is the revival of the Jansenistic dispute in the well-known form of "The Case of Conscience" (see JANSEN), in which F. engaged earnestly on the side of orthodoxy. Notwithstanding the prohibition of his grandfather, the young duke of Burgundy retained all his old affection for his preceptor; and the highest hopes were entertained as to the future career of the pupil of such a school. These hopes were unfortunately cut short by the premature death of the duke in 1712. F. survived him but a short time. He died Jan. 7, 1715.

The works of F. are very voluminous. The latest collected edition extends to twenty 8vo volumes, and embraces every variety of subjects—theology, philosophy, history, literature, ancient and modern, oratory, especially the eloquence of the pulpit, asceticism, and spirituality in all its branches. His correspondence is very extensive and most interesting. Of his early sermons (one of which was delivered in his 15th year), a volume was printed in 1744. Of his mature discourses, two only have reached us in a finished state. They are of the very highest order of sacred eloquence. Of the rest, we can only judge from the skeletons which it was his habit to prepare with great exactness, and of which very many have been preserved. His literary and historical works, many of which were composed for the instruction of his pupil, are filled with allusions and suggestions illustrative of the principles of government and of the relative duties of sovereigns and subjects, far in advance of the time in which he lived. His work on the *Temporal Power of the Mediæval Popes* presents that doctrine in a form which divests it of many of those characteristics which are most objectionable in the eyes of Protestants; and even his spiritual writings in general may be read, and indeed are not unfrequently read, not only without offense, but even with positive advantage, by Christians of all denominations. See card. Bausset's *Histoire de Fenelon* (3 vols., 1808–9); also the *Vie de Bossuet* of the same author. See also the life prefixed to the collected edition of the *Œuvres de Fenelon;* the voluminous correspondence contained in that collection; *Vie de Fenelon*, by M. Gosselin; Wunderlich's *F.* (1873); and Hunnius, *Das Leben F.'s* (1873).

FÉNELON, FRANÇOIS DE SALIGNAC DE LA MOTHE, 1641–79; half-brother of the great archbishop. He was a missionary in Canada, and founded, among the Cayuga Indians who had left New York and settled on the bay of Quinté, an establishment for the education and protection of Indian children. He had a disagreement with Frontenac, the governor of Canada, and was sent back to France.

FENESTELLA, or FENESTRELLA, a genus of polyzoa, resembling the recent "lace coral," very common in paleozoic rocks, from the lower Silurian to the Permian. Thirty species have been described.

FE'NIAN SOCIETY, a political association of Irish or Irish-Americans, the object of which is the overthrow of the English authority in Ireland, and the establishment of a republic. The etymology of the name has been the subject of some discussion. It is traced to the ancient Irish military organization called Fionna Eirinn, which took its appellation from the celebrated hero of Irish legend, Finn (or Fionn) MacCumhail. The accounts of this renowned body, with which the bardic literature of Ireland abounds, are most curious. It was designed as a national militia, and its origin is ascribed, by Keating, to Sedna II., who was monarch of Ireland about 400 years B.C. In time of peace it consisted of three bodies, each formed on the model of a Roman legion, and consisting of 3,000 men; but in war, it was capable of being enlarged to any required limit. Candidates for enrollment were required to be of an honorable family, to be irreproachable in morals, and to bind themselves to observe the laws of justice and morality; they were required to be of a certain height, and strong, supple, and vigorous of body; each being submitted, before enrollment, to an ordeal, in which his powers of speed, strength, endurance, and courage were tested by trial with his future comrades. The bardic accounts of some of those conditions are extravagant and amusing in the highest degree, but the generally historical character of the institution is unquestionable; and it subsisted until the reign of Carbry, son of Cormac MacArt, by whom the body of Fionna Eirinn was disbanded, and the members having, in consequence, transferred their allegiance to Mocorb, king of Munster, suffered an almost total extermination in the battle of Gavra, 284 A.D., which formed the theme of many a bardic poem from the days of Oisin (known in Gaelic legend as Ossian), son of Finn MacCumhail, downwards.

Adopting the name of this ancient military association, the modern Fenians (or Finians) are a secret association for the purpose of overthrowing the alien ascendency of the Saxon, and of restoring to the ancient Celtic population their legitimate status and influence in their native country. It had its first seat in America, where the Irish population has largely increased since the famine of 1846–47. Many of the emigrants being driven from their homes by arbitrary ejectment, or from inability to pay rent, carried with them a sense of fancied wrong, which prepared them for almost any enterprise which seemed to promise revenge. Others had been sympathizers, if not participators in the insurrection of 1848; and almost all were deeply imbued with general political and social discontent. By all these, the prospect of a secret organization for

the establishment of Irish independence was eagerly accepted. The most openly active seat of the organization was in the western states, especially Chicago; but the movement was directed from New York, and possessed ramifications in almost every city of the union. It was conducted by a senate, and consisted of "circles," each directed by a center. The duty of the centers was to enrol members, who bound themselves, generally by oath, "to be faithful to the Irish republic as at present virtually established;" to instruct and practice them in military exercises; to raise funds for the purposes of the association, especially for the purchase of arms and munitions of war; and to extend the organization by every means at their disposal. Agents were sent into Ireland; and to the chief seats of the Irish population in England; and while the work of secret enrollment was industriously carried on in Ireland, measures were openly concerted in America, as well for the raising of funds by private contributions, as for the purchase of arms and military stores. Opportunely, too, for the purposes of the enterprise, the termination of the civil war in America set free a large number of military adventurers who had served as privates or as officers in one or other of the American armies, and whose experience of service was turned secretly but most actively to account in the training of the young recruits enrolled in the Fenian conspiracy in Ireland. Newspapers, moreover, both in America and in Ireland, were established or subsidized for the purposes of the conspiracy; and journals, broadsides, ballads, and other inflammatory publications were largely circulated among the peasantry and artisans. Taverns, alehouses, and other places of entertainment were the ordinary places of meeting; and one of the most formidable of the plans of the conspiracy was an organized attempt to seduce the Irish soldiers from their allegiance, and to prepare the way for their deserting to the ranks of Fenianism, when it should have reached the expected degree of maturity. It became apparent, moreover, that in this, unlike almost all similar movements, pains were taken by the organizers to exclude the Catholic clergy, by whom the Fenian confederation had from the first been steadily resisted, from all knowledge of its character and objects, as well as of the names or number of its members in the several localities; and many of the most active of the leaders were distinguished by the freedom of their religious opinions, and by their unconcealed disregard of clerical authority.

For a time, these designs were carefully concealed, and even when a certain publicity was given to them, the scheme appeared so wild and impracticable that it was regarded as an attempt, on the part of a body of unprincipled adventurers, to practice upon the patriotic susceptibilities of the ignorant and excitable Irish, especially in America. By degrees, however, the movement acquired more solidity, and the government ascertained by reliable information that Fenianism, however corrupt in some of its sources, and however wild and extravagant in its aims, was nevertheless a reality with which it had become necessary to grapple. Measures were taken with great promptness and determination. The habeas corpus act having been summarily suspended, all the known leaders in Dublin and in the provincial districts of Ireland (most of them Irish-Americans) were at once placed under arrest. The chief journal of the conspiracy was suppressed and seized; additional troops were moved into Ireland, and other measures of repression were vigorously carried out. By these energetic measures, public tranquillity was maintained in Ireland; and although prosecutions were instituted, and a few individual conspirators convicted, so universally was the movement condemned by the public opinion of the country, that most of the prisoners were discharged, on condition of their leaving Ireland. But although thus in appearance extinguished, the embers of discontent continued to smolder among the poorer peasantry and the working population of the towns; and a certain prestige was given to the fallen cause by the escape from prison, under circumstances of much mystery and a high degree of romance, of the most active and crafty of the leaders of the conspiracy. His return and that of other exiles to America renewed the agitation in that country. In the early summer of 1866, a raid was attempted into Canada, and although it proved so utter a failure as to cover its projectors with ridicule, an organization was secretly pursued, both in America and in Ireland, which resulted, in the spring of 1867, in an insane and utterly abortive attempt at insurrection at home. The plan of the conspirators was to seize the castle and military stores at Chester, and, having cut off telegraphic communication, to convey these arms to Dublin, and effect, throughout the country, a simultaneous rising in concert with the enterprise at Chester. The attempt was defeated through the treachery of one of the conspirators, by whom the plot was revealed. A partial insurrection, however, took place concurrently with the attack on Chester, in the county of Kerry; and a few weeks later, a more extensive movement was attempted in the counties of Dublin, Louth, Tipperary, Limerick, and Cork. But the persons engaged in it were for the most part either American and Irish-American adventurers, or artisans, day-laborers, and mechanics, generally unprovided with arms, and in many cases scarcely beyond the years of boyhood. The only military enterprises undertaken by them consisted in a series of attacks on the barracks of the rural constabulary, in almost every instance unsuccessful; most of the parties dispersed or were made prisoners after a single night's campaign. The rest betook themselves to the mountains, and after a few days of exposure and hardship, in which they managed to evade pursuit, and carefully avoided all encounter with the military, they were either captured or dispersed. The leaders were tried at a special commission held within the spring of the year 1867, and

tranquillity for a time seemed to be restored in Ireland. Much discontent, however, still continued to exist; and as the foreign organization was uncontrolled, and was still maintained, it remained as a standing element of danger, and a persisting incentive to domestic disaffection. Considerable alarm was created in England and Scotland by the extent and daring of the organization among the Irish population of the large manufacturing towns. In Sept., 1867, an attack was made, in open day, on a police-van in Manchester; the officer in charge was killed, and the prisoners, who were suspected Fenians, were released. A few weeks later, a still more daring attempt was made to blow down Clerkenwell prison wall, with the same object. Alarms were circulated of intended burnings in the cities and towns; gunsmiths' shops and even government stores of fire-arms were broken open and pillaged; and a vague but wide-spread feeling of apprehension was for a time created. Much of this, however, has been removed by the better spirit produced by recent legislation in Ireland, as well as by the marked improvement in the condition of the smaller tenant-farmers, and the scale of wages of agricultural and other laborers. Agrarian outrages have notably decreased in number. The prisoners confined for political offenses have all been released, with the exception of those who had been soldiers, whose detention is a standing grievance. The settlement of the Alabama claim is supposed to have taken out of the hands of the American Fenians one of the most powerful instruments of agitation among the Irish population in America. Since the collapse of Fenianism, Irish grievances have been represented in a corporate form by the *home government association*, a more peaceable body than the Fenians. See HOME RULE.

FENNEC, or ZERDA, *Megalotis*, a genus of *canidæ*, peculiar to Africa, resembling foxes in general form and in the bushy tail, but having eyes adapted for diurnal and not for nocturnal vision, and remarkably large ears. The species are small and beautiful. They feed partly on dates and other vegetable food, also on eggs, and on insects, which they adroitly snap as they pass.

FENNEL, *Fœniculum*, a genus of umbelliferous plants, allied to dill (q.v.), but distinguished by the cylindrical strongly ribbed fruit. The flowers are yellow. All the species are aromatic, and have much divided leaves with thread-like segments. The best known is the COMMON F. (*F. vulgare*), a native of the s. of Europe and of some parts of England. It is a biennial, 3 or 4 ft. high, and is cultivated in gardens, chiefly for the sake of its leaves, which are boiled, and served up with mackerel, with salmon, and occasionally with other kinds of fish, or are employed to form a sauce for them.—SWEET F., ITALIAN F., or CRETAN F. (*F. dulce*), is a plant of much humbler growth, and annual, much cultivated in the s. of Europe, but too tender for the climate of Britain. The young sprouts from the root are sweeter and less aromatic than those of common F., and when blanched, are a very agreeable salad and potherb. The fruit (seed) is longer and paler than that of common F., has a more agreeable odor and flavor, is the favorite aromatic condiment of the Italians, and is used in medicine as a carminative and aromatic stimulant. *Oil of F.*, an aromatic, stimulant, and carminative essential oil, is also made from it.—CAPE F. (*F. capense*), found in the interior of the cape of Good Hope, has a thick, aromatic, esculent root.—The PANMUHOOREE of India (*F. panmorium*) is a species of F. much cultivated in its native country for its sweet, warm, and aromatic fruit, which is much used as a carminative, and in curries.—The GIANT F. of the s. of Europe is a plant of a different genus (*ferula*), and abounds in a fetid juice. It is indeed closely allied to asafetida, but forms a favorite food of buffaloes in Apulia, where it particularly abounds. The dry dead stem is full of a white pith, which is used in Sicily as tinder.

FENRIR, in Norse mythology, the offspring of Loki (the evil genius) and Angurboda (anguish-boding), a giantess from Jötunheim. Loki had a legitimate wife, Sigyn; but with Angurboda he became the father of three monsters: 1. The wolf Fenrir; 2, the Midgard Serpent; 3, the Goddess of Death, whose name is Hell (the English word "hell" is of similar derivation). The wolf Fenrir was bred among the gods, but only Tyr had the courage to give him food. When the gods saw how much he increased daily, and remembered that the predictions were that he was destined to be their destruction, they endeavored to chain him. But he easily broke the first two chains. Then they made a third. It was composed of the sound of a cat's footsteps, a woman's beard, the roots of a mountain, a fish's breath, and a bird's spittle. Fenrir suspected some trick in this, and he said: "If ye bind me so fast that I cannot free myself again, I am well convinced that I shall wait long to be released by you. I am, therefore, not at all desirous to let the cord be fastened upon me. But rather than that ye shall accuse me of want of courage, let one of you place his hand in my mouth as a pledge that there be no guile in the case." The gods hesitated, but finally Tyr put his hand in the wolf's mouth, and the wolf in his vain struggles to break the chain bit off the hand. Fenrir could not break the magic chain, and became a captive to the gods until Ragnröck—the end of time—comes. Fenrir will then break loose, his upper jaw will touch heaven, his nether jaw the earth; fire will blaze from his eyes and nostrils. In the tremendous tumult which precedes the general dissolution, the wolf will swallow Odin (father of gods), and so cause his death. But at the moment will come Vidar, the silent god, who wears a wonderful shoe made from shoe-parings since time began.

With that shoe he will hold down Fenrir's lower jaw, and with his hands tear off the upper jaw, and thus will the monster wolf be slain.

FENS. See BEDFORD LEVEL.

FENTON, a village in Genesee co., Mich., on the Detroit and Milwaukee railroad, 52 m. n.w. of Detroit; pop. '70, 2,353. Water power is furnished by Shiawassee river, and there are a number of manufactories. There are also a Baptist seminary and an Episcopal high school.

FENTON, ELIJAH, 1683–1730; an English poet, master of a free grammar school in Kent. He was tutor to the only son of the earl of Orrery, and on the poet Pope's recommendation gave private literary instructions to Mr. Craggs, secretary of state. He assisted Pope in translating *The Odyssey*. In 1717, Fenton published *Miscellaneous Poems*, and in 1723 appeared *Marianne*, a tragedy. He superintended a new edition of Milton's poems, and also an edition of those of Waller. The epitaph on his tomb was written by Pope.

FENTON, REUBEN E., b. in w. N. Y., 1819. He studied in the local academies, went into law, and was admitted to the bar, but soon afterwards became a merchant. He was representative in congress from 1857 to 1865. In 1864, he was elected governor of the state, and re-elected in 1866, serving in all four years. In 1869, he succeeded ex-gov. Morgan as U. S. senator, serving for six years.

FENTRESS, a co. in n. Tenn., on the Kentucky border, drained by the head waters of the Cumberland river; 525 sq.m.; pop. '70, 4,717—170 colored. The surface is rough, and for the greater part covered with timber. Corn, cattle, and hogs are the staple products. Bituminous coal is found. Co. seat, Jamestown.

FENUGREEK, *Trigonella*, a genus of plants of the natural order *papilionaceæ*, sub-order *leguminosæ*, allied to clover and melilot. The leaves have three obovate leaflets and scythe-shaped stipules. The flowers generally have the *keel* very small, so that the *wings* and *standard* present the appearance of a tripetalous corolla. The COMMON F. (*T. fœnum Græcum*) is a native of the s. of Europe, and of some parts of Asia; it is much cultivated in India as a fodder-plant, and derives its name (*fœnum Græcum*, Greek hay) from its use as fodder in Greece. Its pods are many-seeded, and cylindrical; its seeds have a strong peculiar smell, and an oily bitter taste; the flour made from them is used for emollient poultices, but only in veterinary practice. The seeds of F. were formerly held in great esteem in medicine.—Another species (*T. incisum*), growing spontaneously in many parts of India, is much used as fodder for cattle. The legumes of the ESCULENT TRIGONELLA (*T. esculenta*), also an Indian plant, are used as human food. One species only, the BIRD'S FOOT F. (*T. ornithopodioides*), is a native of Britain, a small plant, growing in sandy pastures near the sea, and not very common.

FENWICK, GEORGE, d. 1657; an English emigrant who settled near Saybrook, Conn., in 1636. He was governor of the colony, with a short interval of absence in England, until Dec., 1644, when he sold his plantation to the Connecticut colony, and returned to England, where he became a col. in the parliamentary army, and was one of the judges on the trial of Charles I.

FENWICK, JOHN, 1618–83; an English Quaker, founder of a colony at Salem, in New Jersey, in 1675. His rights were contested by sir Edmund Andros, governor of New York, and he transferred his claims to William Penn.

FENYES, ELEK (Alexius), a Hungarian geographer and statistical author, was b. in 1807, at Csokaj, in the co. of Bihar. After the usual career of studies in philosophy and law, F. became barrister-at-law as early as 1829; but instead of frequenting the law-courts, he began traveling all over the country, with the purpose of making himself thoroughly acquainted with the state of the Hungarian kingdom, of which there had never before been an authentic survey. The first fruits of F.'s enterprise appeared in 1840, under the title, *Hungary and its Annexed Parts, Geographically and Statistically considered* (6 vols., Pesth). The great prize of 200 ducats was awarded to the author by the Hungarian academy. *The Statistics of Hungary*, in 3 vols., followed (1843); *General Atlas for Hungary* (1845); *Description of Hungary* (1847); *Geographical Dictionary of Hungary* (1851)—all of which were published at Pesth. The whole of F.'s works are written in the Magyar tongue, but several of them have been translated into German, and repeatedly published. Besides that these works are the first true expounders of the state of Hungary, it is also generally admitted that, as to their completeness, solidity, and exactness, they will bear a comparison with the best of kindred works in European literature. During the national government of Hungary (1848), F. was made the chief of the statistical section. After a respite of several years, from failing health, F. again busily engaged for a time in the periodical press as editor of an agricultural paper, but soon retired finally into private life.

FEODO'SIA, or THEODOSIA. See KAFFA.

FEOFF'MENT (*infeudare*), the oldest, and for a long period the only, method for the conveyance of land known in England. F. consisted in the formal conveyance of the land from the feoffor to the feoffee, the former stating distinctly the measure of the estate conferred, whether it was in fee, in tail, or for life. Where no mention of the

duration of the estate was made, the gift was presumed to be for life. This conveyance of the land, in order to be complete; required to be accompanied by delivery of sasine (q.v.). Livery of sasine was of two kinds—viz., by deed, and in law. In the former case, the parties being actually upon the land, the feoffor, by delivery of a twig or a turf, testified his conveyance of the land. In livery in law, the parties being in sight of the land, the feoffor referring to the land gave possession to the feoffee. This mode of F. was ineffectual unless the feoffee entered into possession during the life of the feoffor. Livery in deed might be effected by attorney; but livery in law only by the parties themselves. In the earliest times, these ceremonies completed the conveyance. But by degrees the practice of embodying the transaction in a deed was introduced. When a deed was used, it became customary, but not essential, to indorse on the deed the fact that livery of sasine had been made. By the statute of frauds (29 Car. II. c. 3), it was declared that no estate created by livery of sasine, unless accompanied by writing, signed by the party or his agent, should be of any effect, except as an estate at will; and by 8 and 9 Vict. c. 106, s. 3, a feoffment is void unless accompanied by deed. The law formerly gave so great an effect to a feoffment, that even when the party ostensibly making the conveyance was not lawfully seized in the estate, the feoffment was sustained. This was called a tortious conveyance; the party in whose favor it was made was said to have acquired an estate by wrong, the rightful owner was disseised, and was left to his right of entry (q.v.). But by the act last mentioned, this tortious effect of a feoffment was removed. It must be observed that the practice of feoffment above described, and which has existed in England from time immemorial, differed materially from the old form of investiture in use in strictly feudal times, and from that which still prevails in Scotland. In England, the transaction was simply a conveyance by the actual holder of the land to a new tenant, testified by certain ceremonies, but requiring no confirmation by a third party to complete it. But by feudal usages, every holder of land was the vassal of some superior lord, to whom he owed suit and service, and without whose consent he could not even part with his land; hence no conveyance was complete without the reception of a new tenant by the lord paramount as his vassal. In like manner, to this day, in Scotland, no transfer of heritage is complete without the formal confirmation of the superior; and although by recent legislation the old feudal usages, which for two centuries have existed as landmarks, telling us of a system now passed away, have been abolished, yet the fact of acceptance by the superior, and the performance of the pecuniary services attendant on that acceptance, are still preserved. See INFEFTMENT, SASINE, FEUDAL SYSTEM.

Feoffment to Uses.—This was an application of the feudal form of *feoffment* in England in order to effect a conveyance in trust. The common law courts, adhering to feudal rules, refused to recognize any interest in the land but that of the person actually infeft; but where a F. was made to one man *to the use* of another, the equity courts gave effect to the transaction by compelling the party infeft to hold in trust for the third person, called the *cestui que use*, who was said to have an equitable estate, in contradistinction to the legal estate which remained in the feoffee to uses. By the statute of uses, it was enacted that in all such conveyances the actual legal estate should pass to the *cestui que use*. See USES.

FER DE LANCE, *Craspedocephalus lanceolatus*, a venemous serpent of South America and the West Indies. It is very prolific; grows to a length of 5 or 6 ft.; gives no warning of attack, and its bite is often fatal. Those who recover through the application of counter-irritants are usually affected for years with paralysis or diseases of the blood.

FE'RÆ (Lat. *ferus*, wild), in the Linnæan system of zoology, an order of *mammalia*, nearly corresponding to the *carnaria* (q.v.) of Cuvier.

FE'RÆ NATU'RÆ (Lat. of a wild nature). Those animals which flee the dominion of man, whether beast, bird, or fish, and retain their natural freedom, are thus characterized in the Roman law. According to that system, such animals became the property of any one who might catch them, irrespectively of the ownership of the soil on which they were taken, on the principle that "natural reason gives to the first occupant that which has no owner."—*Inst.* ii. tit. i. s. 12. But this regulation did not prevent the prohibition of trespass. "Of course, any one who enters the ground of another for the purpose of hunting or fowling, may be prohibited by the proprietor, if he perceives his intention of entering" (*Ib.*). This right on the part of the proprietor did not affect the property of the animal taken, though it gave him an action against the trespasser. If a wild animal escaped from its captor, his proprietorship instantly ceased, and the animal might again be appropriated by its captor. This occurred even though the animal was not out of sight, if it could not be pursued without great difficulty. Even a wounded animal was not the property of the sportsman till it was caught, though the point which is decided in this sense (*Inst.* ii. tit. i. s. 13) is said to have been one on which difference of opinion had prevailed. Except in so far as it is modified by the statutes, which will be explained under GAME-LAWS, these provisions form part of the common law both of England and Scotland. Animals which are said to be F. N., or of a wild and untamable disposition, any man may seize upon and keep for his own use or pleasure; but if they escape from his custody, though without his voluntary abandonment, it naturally

follows that they return to the common stock, and any man else has an equal right to seize and enjoy them afterwards (Stephen's *Blackstone*, i. 161). The law of Scotland followed the law of Rome so closely in this, as in other respects, that the passage from the *Institutes* of Justinian above referred to was translated into one of the oldest collections of Scottish laws—that, viz., contained in the Cromortie MS., the date of which may be assigned to the latter part of the 14th c., and which certainly is not later than the reign of Robert III. (Irvine's *Game-laws*, p. 20, and statutes published by the record commission, appendix v. p. 385); see also Stair, ii. 1, 5, and 33; and Ersk. ii. 1, 10. Under animals, F. N., the law of Rome included *bees*, unless included in a hive, or *skep*, as it is still called in Scotland, or unless the proprietor be in pursuit of them, and has kept them in sight. See BEE. Domestic animals, though they stray, do not cease to be the property of those to whom they have belonged; but as regards animals which have a tendency to return to a state of nature, the rule of the Roman law was, that property in them continued so long as they had the intention of returning (*animum revertendi*), or rather, one would imagine, the habit of doing so. This rule applied to peacocks and pigeons, but not to fowls and geese; with reference to which it was provided, that though they should be frightened and take to flight, they were still yours, though you might have lost sight of them, and that whoever detained them with a view to his own profit, was guilty of theft. See DOVECOT, WARREN, FOREST LAWS; FISHES, ROYAL.

FERDINAND I., emperor of Austria (1835–48), eldest son of Francis I. by his second marriage with Maria Theresa of the house of Naples, was b. at Vienna, 19th April, 1793. He was from the first of a weak constitution, and was unfortunate in those to whom his education was intrusted. Yet he showed on all occasions a goodness of heart, which was fostered by the example of his uncle, the archduke Charles, to whom he was much attached. While crown-prince, he traveled through his Italian provinces, Switzerland, and part of France, and took great interest in manufacturing industry. In 1835, he succeeded his father on the throne. It was expected from his character that he would inaugurate a more liberal policy than his predecessors had pursued, but the absolutist principles that seem destined to rule forever the Austrian cabinet, triumphed, and Metternich was allowed to carry on the government. It now became obvious that F. sadly lacked moral decision, and his "goodness" exhausted itself in numerous acts of clemency and benevolence. Nevertheless, during his reign, the industry of Austria made a great advance, and the great net-work of railroads and highways was begun. The insurrection in Galicia, 1846, led to the annexation of Cracow to Austria. No country was more affected by the European movement that began in the winter of 1847–48 than Austria, though the revolutionary storms that shook the empire cannot be attributed to any want of good-will to his people on the part of F., but only to a complete want of political wisdom. On the disturbances breaking out in Mar., he consented to the dismissal of Metternich, the appointment of a responsible ministry, and granted the outlines of a constitution. In May, he retired with his court to Innspruck, but was induced to return to the capital in Aug. At last, the Oct. insurrection in Vienna made him again leave the palace of Schönbrunn, and retire to Olmütz, where, on 2d Dec., 1848, he abdicated in favor of his nephew, Franz Joseph. He afterwards resided at Prague, where he died, June 29, 1875. He married, 27th Feb., 1831, Caroline, daughter of Victor Emmanuel I., king of Sardinia, but had no children.

FERDINAND I., 1379–1416, of Aragon and Sicily, surnamed THE JUST, was the younger son of John I. of Castile and Leonora of Aragon. On the death of his elder brother Henry III. in 1406, he refused the crown of Castile which the nobles had offered, but in accordance with his brother's will undertook the office of regent during the minority of his nephew John II. In this capacity he distinguished himself by his prudent administration of home affairs, and by his victories over the Moors by land and sea. He took the title *de Antequera* on the surrender of that fortress after a siege of five months, 1410. On the death of his maternal uncle, king Martin of Aragon and Sicily, his claims to the throne, though not derived through the usual laws of descent, were taken up and keenly pressed by a powerful party in the state. The question of the succession was ultimately referred to a committee of nine judges equally representing Catalonia, Valencia, and Aragon; and the result was his election by a majority in 1412. After he had defeated, at Balaguer, count Jayme of Urgel, the last and most formidable of his rivals, he was formally crowned at Saragossa in 1414. From the year 1378, Europe had been scandalized by the spectacle of the papal schism; and since 1410, three rival popes had been claiming the obedience of the faithful. At the council of Constance in 1414, Ferdinand of Aragon was a prominent supporter of the Spaniard, Benedict XIII. (Peter de Luna), who had been deposed at Pisa in 1408. The deposition of John XXIII., and the abdication of Gregory XII. in 1415, having opened the way for peace, Ferdinand consented to be present at the meeting of Sigismund with the ambassadors of France, Castile, and Navarre, in Perpignan; and after long temporizing he ultimately agreed, for the sake of the unity of the church, to withdraw his obedience from Luna. He died in the following year at Ygualada, and was succeeded by his son Alphonso V., the conqueror of Naples. [From *Ency. Brit.*, 9th ed.]

FERDINAND II., King of Aragon and Sicily. See Ferdinand V. (THE CATHOLIC) OF CASTILE, *ante*.

FERDINAND I., Emperor of Germany, 1556–64, was b. in Spain, 1503. He was the son of Philip I., and brother of Charles V., whom he succeeded in the empire in 1556, having been previously elected king of Rome. F. had married, in 1521, Anna, daughter of Ladislaus VI., king of Bohemia and Hungary. When her brother Louis fell in 1526 in battle with the Turks, leaving no issue, the crown was claimed by F. in right of his wife. This involved him in a long and bloody struggle with a rival, John of Zapolya, who laid claim to Hungary, and who, as well as his son Sigismund, was supported by Soliman, sultan of the Turks. F. at last gained the upper hand, bought off the Turks by a yearly tribute, and finally secured Hungary and Bohemia to the house of Austria. When he was elected emperor, the concessions he had made to the Protestants caused the pope, Paul IV., to refuse to acknowledge him. That pope dying, his successor, Pius IV., was more complaisant; but the electors resolved that for the future the consent of the pope should not be asked; and this was carried out. F. made several attempts to reconcile the Protestants and Catholics, and urged, though fruitlessly, the reformation of abuses on the council of Trent. He died in 1564, leaving the reputation of a prudent and enlightened ruler, and was succeeded by his son, Maximilian II.

FERDINAND II., Emperor of Germany, 1619–37, was b. at Gratz, 9th July, 1578. He was grandson of Ferdinand I., his father being Charles, archduke of Styria, the younger brother of Maximilian. F.'s mother, Maria of Bavaria, early inspired him with hatred against the Protestants. He was educated by the Jesuits at Ingolstadt, along with Maximilian of Bavaria; and at Loretto he had taken a solemn oath, before the altar of the Mother of God, to reinstate Catholicism as the sole religion of his dominions, at any cost. As soon as he succeeded to the government of his own duchy of Styria, he set about putting down Protestantism by force. He attempted the same in Bohemia and Hungary, of which countries he had been elected king during the lifetime of Matthias Corvinus; but though at first unsuccessful, and even in danger of losing his dominions, he ultimately managed, with the aid of the Catholic league and of the elector George I. of Saxony, to subdue them. Bohemia lost all its privileges. By hanging, confiscation of property, and the banishment of innumerable families, the wretched land was reduced to obedience; and the introduction of the Jesuits, and rigorous persecution of Protestants, re-established Catholicism. Meanwhile, F. had been elected emperor of Germany (1619). The war, which properly ended with the subjugation of Bohemia, was at the same time transferred to the rest of Germany, and took the character of a religious war—the famous "thirty years' war" (q.v.). The two imperial generals, Tilly and Wallenstein, were opposed by a confederacy of the Protestant states of Lower Saxony, with Christian IV. of Denmark at their head; but the confederates were defeated by Tilly at the battle of Lutter, in Brunswick, and forced to conclude peace (Lübeck, 1629). Confident in the ascendency which he had acquired, F., in the same year, issued an edict of restitution for the whole of Germany, taking away from the Protestants nearly all the rights they had acquired by a century of struggles; and the troops of Wallenstein and of the league were immediately set to work to carry it out in several places. But further proceedings were soon arrested by the dismissal of Wallenstein, on which the diet of the empire at Regensburg had insisted; and by the opposition of Richelieu, who put every wheel in movement to curb the power of the house of Austria. At this time also a formidable opponent to the schemes of the emperor appeared in the person of Gustavus Adolphus of Sweden (q.v.). After the murder of Wallenstein, the connivance at which is an ineffaceable blot on F.'s memory, the imperial commander, Gallas, gained, 1634, the battle of Nordlingen, which had the effect of detaching Saxony from the Swedish alliance; but the ability of the Swedish generals, for whom Austria had none that were a match, and the open part that France now took in the contest, brought back the balance of victory so far to the Protestant arms, that when F. died, Feb. 15, 1637, he had given up the hope of ever attaining his objects. His reign is one of the most disastrous in history; for Germany owes him nothing but bloodshed, and misery, and desolation.

FERDINAND III., Emperor of Germany, 1637–57, the son of Ferdinand II., was b. 11th July, 1608. He was not so much under Jesuitical and Spanish influence as his father. Having accompanied the armies in their campaigns after the death of Wallenstein, he had witnessed the miseries of war, and was inclined for peace; but the conflicting interests of the individual belligerents hindered any unity of view, and made it necessary to proceed with the contest. Thus was this miserable war protracted, ever extending in circuit and increasing in devastation owing to the growing licentiousness of the soldiery. At last, in 1643, a congress met at Münster to arrange terms of peace, which was concluded in 1648, and is known as the peace of Westphalia. At the diet of the empire, 1653–54, the last presided over by an emperor in person, F. effected important alterations in the administration of justice. He died, 2d April, 1657, shortly after concluding an alliance with Poland against Sweden. His son Leopold I., succeeded him in the German empire.

FERDINAND I., 1423–94; King of Naples; illegitimate son of Alphonso V. of Aragon and I. of Naples. He succeeded his father on the throne of Naples in 1458, but the pope favored John of Anjou. The latter invaded the kingdom and defeated Ferdinand, who fled to his capital. But the succeeding pope favored him,

and with the assistance of Scanderbeg, the famous Albanian chief, John was defeated with great loss, Aug. 18, 1462. In 1480, the Turks captured Otranto and murdered most of the inhabitants, but in the next year they were driven out and the place recaptured. In 1485, a number of nobles revolted. Ferdinand promised a general amnesty if they would make submission, and then treacherously murdered them. He died just as Charles VIII. of France was about to invade his dominions. His reign favored the advance of his people in knowledge and prosperity.

FERDINAND II., King of Naples, 1468–96; grandson of Ferdinand I., and son of Alphonso II., who abdicated the throne of Naples in the son's favor in 1495. The kingdom was invaded by Charles VIII. of France, and Ferdinand fled. When the French left Naples he was recalled, and, with the aid of Gonsalvo de Cordova, the great general of Ferdinand V. of Spain, he drove out the French invaders a short time before his death.

FERDINAND III., King of Naples. See FERDINAND V. (THE CATHOLIC) OF CASTILE, *ante*.

FERDINAND I., 1345–83; King of Portugal, styled EL GENTIL (the Gentleman), son of Pedro I. (not Pedro the cruel). He succeeded his father in 1367. On the death of Pedro of Castile in 1369, Ferdinand, as great-grandson of Sancho IV. by the female line, claimed the vacant throne, against the kings of Aragon and Navarre, and afterwards against the duke of Lancaster (married in 1370 to Constance, the eldest daughter of Pedro). Meanwhile, the crown had been actually assumed by Henry of Trastamara, the brother (illegitimate) and conqueror of Pedro. After one or two indecisive campaigns, all parties were ready to accept the mediation of pope Gregory XI. The conditions of the treaty, ratified in 1371, included a marriage between Ferdinand and Leonora of Castile. But, before the union could take place, the former had suddenly become passionately attached to Leonora Tellez, the wife of one of his own courtiers, and having procured a dissolution of her former marriage, he lost no time in making her his queen. This strange conduct, although it raised a serious insurrection in Portugal, did not at once result in a war with Henry; but the outward concord was soon disturbed by the intrigues of the duke of Lancaster, who prevailed on Ferdinand to enter into a secret treaty for the expulsion of Henry from his throne. The war which followed was unsuccessful; and peace was made in 1373. On the death of Henry in 1379, the duke of Lancaster once more put forward his claims, and again found an ally in Portugal; but, according to the continental annalists, the English proved as offensive to their companions in arms as to their enemies in the field; and Ferdinand made a peace for himself at Badajoz in 1382, it being stipulated that Beatrix, the heiress of Ferdinand, should marry king John of Castile, and thus secure the ultimate union of the crowns. On the death of Ferdinand at Lisbon in the following year, leaving no male issue, the direct Burgundian line, which had been in possession of the throne since the days of count Henry (about 1112), became extinct. The stipulations of the treaty of Badajoz were set aside, and John, grand-master of the order of Aviz, Ferdinand's illegitimate brother, was proclaimed. This led to a war which lasted for several years. [From *Ency. Brit.*, 9th ed.]

FERDINAND (AUGUSTUS FRANCIS ANTHONY), b. 1816; titular king of Portugal, duke of Saxony, field marshal-general; married, 1836, to Donna Maria II. da-Gloria Jeanne-Charlotte-Léopoldine-de-Cruz-Françoise-Xaviere-de-Paule-Isidore-Michaëla-Gabrielle-Raphaëla-Louise-Gonzague, queen of Portugal. He received the title in 1837, and after the death of the queen he acted as regent till 1855, during the minority of his son. In 1870, Prim and Serrano offered Ferdinand the crown of Spain, but he declined it. In 1869, he married (in Boston, Mass.,) Eliza Hensler, who had resided in Springfield, the daughter of a German shoemaker, a lady of rare beauty, and afterwards celebrated in America and Europe as a vocalist. She bears the title of countess of Edla. The king without a crown is somewhat celebrated as a painter and engraver.

FERDINAND I., king of the Two Sicilies, was the son of Charles III., of Spain, and b. 12th Jan., 1751. When Charles ascended the Spanish throne in 1759, F., though a minor, succeeded him on that of Naples under a regency. After his marriage, in 1768, with Maria Carolina, daughter of the empress Maria Theresa, he fell completely under her influence, and lost all his former popularity. The queen and her favorite minister, Acton (q.v.), ruled the kingdom. F. joined England and Austria against France in 1793, but in 1801 was forced to enter into a treaty with the first consul. A subsequent violation of this treaty compelled him, in 1806, to take refuge in Sicily, under the protection of the English. A French army marched into Naples, and took possession of the kingdom, which Napoleon bestowed first on his brother Joseph, and afterwards on Murat. F. was reinstated by the congress of Vienna, and entered Naples, after Murat's flight, in June, 1815. His queen had died in 1814. During the revolution of 1820, he was obliged to introduce the Spanish constitution of 1812, but abolished it next year, with the help of Austrian arms. He, however, expelled the Jesuits, and abolished superfluous convents; acts that may, perhaps, partly atone for his bloody persecution of the republicans in 1800, and his general antipathy to enlightened principles of government. He died Jan. 4, 1825, and was succeeded by his son Francis I., who died in 1830.

FERDINAND II., king of the Two Sicilies, was the son of Francis I., by his second wife, Isabella Maria, of Spain, and was b. 12th Jan., 1810. He succeeded his father in 1830. The country was in the most wretched condition; and all eyes were turned to the young king, the beginning of whose reign was marked by various acts of clemency towards political enemies, and also by the introduction of reforms in the economy and government of the country. But it was not long before he began to listen to foreign counsels, which saw danger for the whole peninsula in liberal measures. From that time, Naples became the scene of incessant conspiracy, insurrection, bloodshed, and political prosecutions. F. yielded to the storm of 1848, and granted a constitution to both parts of his dominions; he was even obliged to take part in the war against Austria, in Northern Italy. The Sicilians mistrusted, and with reason, the king's proceedings, and declared that he and his family had forfeited the Sicilian crown. F. followed the constitution so far as to call the chambers together, but quickly dismissed them, impatient of any interference with his authority. After the subjugation of Sicily, in 1849, when the reaction began to set in all over Italy, he hastened completely to set aside the new constitution; while all who had taken any part in state reforms were subjected to those cruel persecutions that the letters of Mr. Gladstone have held up to the execration of the world. F. died 22d May, 1859, and was succeeded by his son Francis II.

FERDINAND I., 1000–1065; surnamed THE GREAT, first sovereign of independent Castile, was the second son of Sancho III., of Navarre, who, about 1026, compelled Bermudo III., of Leon, the last direct descendant of Pelayo in the male line, to surrender his rights over Castile, and also to give his sister Sancha in marriage to Ferdinand, then regent of that province. Sancho, towards the close of his energetic life, divided his extensive domains among his four sons, Castile being the portion allotted to the second. Bermudo of Leon, shortly after Sancho's death, sought to recover his lost possessions, but was defeated and slain. Ferdinand, now king of Leon as well as Castile, by a conciliatory yet firm policy, soon established his authority over his conquered subjects; and when, in 1053, his dominions were invaded by his brother Garcia III. of Navarre, the attack resulted in the death of the latter on the battlefield of Atapuerca, near Burgos, and the annexation of a large portion of his dominions. At an early period of his reign Ferdinand began to direct his arms against the Moors; and by a series of successful campaigns he extended the Christian frontier from the Douro to the Mondego, and reduced to vassalage the emirs of Toledo, Saragossa, and Seville. Even the Arab chronicles mention his victories from Badajoz, in Estremadura, to Albarracin in Aragon. He had set out on an expedition against Valencia, when he was seized with a mortal illness, which compelled him to retire to his capital, where, after having divided his dominions among his three sons, he died. Ferdinand appears to have laid claim to the title of "emperor" of Spain; and Mariana alleges that at a council held at Florence in 1055, the emperor Henry III., lodged a formal complaint against this infringement of his rights of suzerainty; that this complaint was sustained by Pope Victor II., but that at a conference afterwards held at Toulouse a decision favorable to Ferdinand's imperial rights, so far as they related to the territories which had been conquered from the Moors, was given, chiefly in consequence of the representations made by the famous Cid, Ruy Diaz de Bivar. Though this statement can be received not without reserve, it is certain that both in virtue of the ascendancy he won for himself in Christian Spain, and also in virtue of his notable successes over the Moors, Ferdinand I. is fully entitled to the rank which tradition has assigned him among the greater Spanish sovereigns. [From *Ency. Brit.*, 9th ed.]

FERDINAND II., 1136–88; younger son of Alphonso VIII., became king of Leon on the death of his father in 1157. A dispute that arose between him and some of his powerful nobles gave his brother Sancho III. of Castile a pretext for invading his territory, but the timely submission of Ferdinand averted serious disaster. The death of Sancho shortly afterwards led to a military occupation of Castile by Ferdinand, professedly in the interests of his nephew Alphonso III.; and this occupation lasted till the marriage of Alphonso to Leonora, daughter of Henry II. of England, in 1170. Meanwhile Ferdinand, having repudiated his wife, Dona Urraca, had become involved in a war with his father-in-law, Alphonso I. of Portugal, which resulted in the defeat and capture of the latter at Badajoz in 1169. The later years of the reign of Ferdinand II. were distinguished by sundry successes over the Moors, especially by a brilliant victory at Santarem; and also by the incorporation of the great military order of Alcantara, which received its first regular charter from pope Alexander III. in 1177. He died at Benavente, Leon, in 1188, and was succeeded by his son Alphonso IX. [From *Ency. Brit.*, 9th ed.]

FERDINAND III., 1200–52, King of Castile and Leon, usually known as SAINT FERDINAND, was the son of Alphonso IX. of Leon, and of Berenguela, sister of Henry I. of Castile. On the death of Henry, without issue, in 1217, the just title of Blanche, the elder of the surviving sisters, was set aside, and Berenguela procured the proclamation of Ferdinand. He rapidly secured the homage of the towns and submission of the nobles, especially of the brothers Alvaro and Ferdinando de Lara. On the death of his father in 1230, he ultimately, though not without dispute, became king of Leon as well as Castile, thus finally uniting the two kingdoms under one crown. Following up the

advantage which had been gained for the Christian arms by his father and the allied kings in the great battle at Las Navas de Tolosa in 1212, he devoted all his energies to the prosecution of the Moorish war. Among his conquests may be mentioned those of Ubeda in 1234, of Cordova in 1236, of Jaen in 1245, and of Seville in 1248. He was planning an invasion of Africa, when he died at Seville, leaving his kingdom to his eldest son Alphonso X. Though not canonized till centuries afterwards (by Clement X. in 1671), he came to be popularly known as *el Santo* from a very early period. Distinguished though he was for great military talent, he was still more remarkable for his religious zeal. Like his younger cousin Saint Louis of France, he was supremely a champion of the Roman Catholic faith. It was not on the field of battle alone that his ardor was displayed. None of his Spanish panegyrists fail to relate how it was his wont to assist in carrying wood for burning the followers of the Albigensian heresy, and how sometimes with his own royal hands he applied the torch to the pile. While as a crusader he is hardly eclipsed by Louis, he contrasts very favorably with him as a sincere friend of learning. He was the original founder of the university of Salamanca, which his son and successor did so much to foster and encourage. He it was, also, who caused to be translated into the vulgar tongue the Fuero Juzgo or code of Visigothic laws, which, as collected and translated at his instance, has the double interest of being one of the oldest extant specimens of Castilian prose, and also of being the foundation of Las Siete Partidas, the code of Christian Spain, which was finally drawn up by Alphonso the wise. [From *Ency. Brit.*, 9th ed.]

FERDINAND IV., 1285–1312; King of Castile and Leon, succeeded his father, Sancho IV., in 1295. The years of his minority were disturbed by a series of civil wars caused by the pretensions of his cousins Don Juan and Don Alonso de la Cerda to the crown, by the disputes of Haros, Laras, and other nobles about their privileges, by the restlessness of the municipalities, and by the ambition of the neighboring kings of Portugal, Aragon, and Granada. The queen-mother, Maria de Molina, on each new outbreak succeeded in procuring peace by diplomatic tact and judicious compromise. Secure at last in possession of his throne, Ferdinand was free to pursue the traditional policy of war against the Moors; and in carrying it out he was aided by pecuniary grants from his own nobles and from the pope (Clement V.), as well as by the spoils of the templars on the extinction of that order in 1310. His chief exploit, as recorded by the historians, both Spanish and Arab, was the expedition against Algeciras in 1309, which, while unsuccessful in its main object, resulted in the surrender of Gibraltar and the cession of other strongholds. In the course of a subsequent campaign he died suddenly at Jaen. According to Mariana, he had on the 8th of Aug. preceding condemned to death without lawful trial two brothers of the name of Carvajal. These protesting their innocence, had summoned him to meet them within thirty days at the bar of God; hence his surname, *el Emplazado*, "the Summoned." He was succeeded by his infant son, Alphonso XI.—[From *Ency. Brit.*, 9th ed.]

FERDINAND THE CATHOLIC, 5th of Castile, 2d of Aragon, 3d of Naples, and 2d of Sicily, was b. 10th Mar., 1452. He was the son of John II., king of Navarre and Aragon; and in 1469 married, at Valladolid, Isabella, sister of Henry IV. of Castile. Even in the lifetime of his father, events were paving the way for the subsequent union of the two kingdoms of Castile and Aragon. On the death of Henry IV. of Castile in 1474, the cortes refused to acknowledge the legitimacy of his daughter Juana, and proclaimed Isabella and her husband F. joint-sovereigns. A war ensued, in which they were completely successful. In 1479, F. becoming king of Aragon on the death of his father, the two kingdoms of Aragon and Castile were united in the persons of F. and Isabella. Isabella, however, as long as she lived, maintained her position as queen of Castile, and allowed her husband no other share in the government than the privilege of affixing his signature to the decrees, and of uniting his arms with her own. F.'s whole reign was an uninterrupted series of successful wars. In Castile, he distinguished himself by the effectual suppression of the banditti, who had become formidable in the confusion resulting from the civil wars. This he accomplished by reorganizing and putting in force against them the *hermandad*, or brotherhood, a kind of Spanish militia, composed of the citizens and the country-people. But F., whose craft and vigor were quite Machiavelian, was not content with taking strong measures against the Castilian outlaws: he also resolved to break the power of the feudal nobility, and make good use of the *hermandad* in carrying out this design. Cities and towns were encouraged to make themselves independent of the nobles, who were deprived of many important privileges. Among other humiliations, they were subjected to the ordinary tribunals of justice. The establishment of the inquisition in 1478–80, although primarily and mainly intended to further "religious" ends, likewise helped to lessen their influence. F. also strengthened his power by vesting in himself and his successors the grand-mastership of the military orders of Calatrava, Alcantara, and Santiago. In all his schemes, F. was ably seconded by his queen Isabella, and by the celebrated cardinal Ximenes. The year 1492 was the most brilliant in his reign, and is one of the most important in the history of the material progress of the world. It was signalized by the discovery of America by Christopher Columbus, though the honor of having aided the great navigator belongs not to F., but to Isabella. The same year witnessed the

capture of Granada, and the retreat of the last Moorish monarch into Africa. F., who had a true Spanish hatred of heresy, immediately issued an order for the expulsion of the Jews from the conquered kingdom; and, in consequence, 160,000—some say 800,000—of his new subjects were compelled to scatter themselves over Europe This act was neither wise nor Christian, but it was in accordance with the religious barbarism of the age, and especially of Spain. It was followed, several years after, by the persecution and expulsion of the Moors—an act still more unwise than the former, for the Moors of Granada were unquestionably the most industrious, civilized, and refined inhabitants of the peninsula. F. was as successful abroad as at home. He was victorious over Alfonso V., king of Portugal; while his general, Gonzalvo de Cordova, twice wrested Naples from the French—the second time in 1503—after which it remained permanently in F.'s possession. In the following year, Isabella died; and in 1505, he married Germaine de Foix, a niece of Louis XII. of France. He took part in the famous league of Cambrai formed against Venice in 1508; made himself master of various towns and fortresses in Africa; and in 1512, conquered the kingdom of Navarre; thus becoming monarch of Spain from the Pyrenees to the rock of Gibraltar. He died at Madrigalejo, Jan. 23, 1516; and was succeeded by his grandson, Charles V. To F. and Isabella, Spain owes her unity and greatness as a nation; and, in the no less skillful hands of their successor, she exercised an imperial influence over Europe, which it required Luther and the reformation to check. See Prescott's *History of the Reign of Ferdinand and Isabella of Spain* (1838).

FERDINAND VI., 1713–59; King of Spain, sometimes called THE SAGE, the younger son of Philip V. and Maria Louisa of Savoy. On the death of his elder brother, Louis, in 1725, Ferdinand was proclaimed prince of the Asturias; and in 1729 he was betrothed to Barbara, daughter of John V. of Portugal. He succeeded his father on July 9, 1746. Since 1739, Spain had been involved in protracted war, first with England in consequence of disputes relative to British interests in the West Indies, and afterwards, since 1740, with Austria on the accession of Maria Theresa. It was Ferdinand's first endeavor on coming to the throne to secure peace for his exhausted country, and one of the earliest acts of his government was to order the withdrawal of the Spanish troops from Italy. Soon afterwards negotiations were opened for peace with England; and these, though frequently interrupted, ultimately resulted in the treaty of Aix-la-Chapelle, which terminated the war of the Austrian succession, thus restoring peace to Europe, Oct., 1748. Weak in health and despondent in temperament, Ferdinand had no inclination thenceforward to take an active part in European affairs, and the management of the public business he abandoned almost entirely to his ministers Ensenada, Carvajal, and Wall. These, however, always found it necessary to take into their counsel the queen, to whom Ferdinand was much attached, the royal confessor Rabago, and the singer Farinelli, whose musical powers had given him extraordinary influence. During this reign the condition of Spanish finance was much improved; agriculture, commerce, and the arts were encouraged; by a concordat with pope Benedict XIV. in 1753, many abuses of ecclesiastical patronage were reformed; and the affairs of the army and navy were not neglected. On the outbreak of the seven years' war in 1756, Spain steadfastly maintained a strict neutrality, notwithstanding the repeated efforts of both France and England to secure her intervention, the former offering Minorca and the latter Gibraltar as the price of her assistance. On the death of his consort in 1758, Ferdinand fell into a profound melancholy, which issued in a confirmed insanity, under which he died at Villaviciosa. Leaving no issue, he was succeeded, according to the terms of the treaty of Aix-la-Chapelle, by his half-brother, Charles III.—[From *Ency. Brit.*, 9th ed.]

FERDINAND VII., King of Spain, b. 14th Oct., 1784, was the son of king Charles IV. and the princess Maria Louisa of Parma. Although he had the advantage of excellent preceptors, especially the canon Escoiquiz, in his youth, yet the machinations of the notorious Godoy, minister of Spain, prevented him from enjoying any opportunities for the intelligent exercise of his faculties. A deliberate attempt was made by his mother and Godoy to degrade him into a lover of mere animal pleasures, that their influence and authority might be unrestrained. F. soon conceived an aversion to the minister, which was increased by his marriage in 1802 with the amiable and accomplished Maria Antonietta Theresa, daughter of Ferdinand I., king of the Two Sicilies. This lady, who endeavored to maintain her husband's dignity, died 21st May, 1806, of grief, as is supposed, at the insults offered to her by Godoy, the king himself, and above all by the queen. Suspicions of foul play, however, were entertained by Ferdinand. Mainly for the purpose of gratifying their hatred towards Godoy, a number of the nobles, headed by the duke of Infantado, assembled round the crown-prince. A false step that the latter now took proved the beginning of great misery to Spain. By the advice of the canon Escoiquiz, he wrote a letter to Napoleon, in which he expressed a wish to marry the eldest daughter of Lucien Bonaparte. This letter fell into the hands of the minister himself, and the prince was in consequence arrested in the Escorial, 28th Oct., 1807, and declared a traitor by a royal proclamation, written in Godoy's own hand, and addressed to the council of Castile. The animosity of the people towards the minister led to the revolution of Aranjuez, and the king abdicated in favor of F., 19th Mar., 1808. Almost immediately after, however, Charles wrote to Napoleon, declaring his abdication to be

forced. Napoleon, who had designs of his own upon Spain, refused to recognize F. as king, but sent him an invitation to meet him at Bayonne. In spite of all warnings to the contrary, F. repaired to Bayonne, at which place he arrived on the 20th April, and was received with distinction by Napoleon. Meanwhile, however, the French troops under Murat had marched across the Pyrenees, and taken possession of the Spanish capital. The wretched squabbles and recriminations that now took place between Charles and his son, and which were encouraged by Napoleon, ended in F.'s renouncing the crown of Spain unconditionally, receiving for himself and his posterity an annual income of 600,000 francs from the crown revenues of France, and likewise the palace and parks of Navarre. The château of Valençay, belonging to prince Talleyrand, was assigned to him as a residence, along with his brother Don Carlos, his uncle Don Antonio, the canon Escoiquiz, and the duke of San Carlos. Here his proceedings were watched with the utmost vigilance; and it was not till the end of the year 1813, when the splendid series of British triumphs in the peninsula had made a longer occupation of the country by the French impossible, that Napoleon offered to reinstate him on the throne of Spain. On the 14th of Mar., F. returned to Spain, where he was received with every demonstration of loyalty and affection. Very unfortunately for Spain, and also for his own comfort, F. had, in the mean time, learned to associate liberalism with Jacobinism, and both with Bonapartism, so that, on his reaccession to power, he threw himself into the hands of the clergy and the reactionary portion of his nobility. Even before his arrival in Madrid, he refused to swear or accede to the constitution of the cortes, as interfering too much with the free exercise of regal authority, though he promised another in its place. From the moment, however, that he assumed the reins of government, a series of transactions took place which excited the astonishment and disgust of all liberal-minded politicians in Europe. Instead of the promised constitution, there commenced a fearful system of persecution against all who were suspected of holding liberal opinions; and executions, imprisonment, exile, and confiscation of property reigned in all parts of the kingdom. The monastic orders, the inquisition, and the rack were restored, and every expression of opinion rigorously repressed. At length, in Jan., 1820, an insurrection broke out, and F. was compelled to restore the constitution of the cortes of 1812; but the French government interfering by force of arms, absolutism was restored in Spain in 1823. In 1829, F. married the notorious Maria Christina. She was his *fourth* spouse. By the first three, he had no children. Maria, however, bore him two children: Isabella II., the late queen of Spain, and the infanta Maria Louis, who married the duke of Montpensier. By the influence of Maria Christina, F. was induced to abrogate the Salique law excluding females from the throne, and to restore the old Castilian law of cognate succession. This step led to a dangerous combination among the adherents of the king's brother, Don Carlos, even during the lifetime of the former, and after his death, to a civil war. See DON CARLOS, ESPARTERO, etc. On the 20th June, 1833, the deputies, cortes, and grandees of the kingdom took the oath of fealty, and did homage to the princess of the Asturias, and F. died on the 29th Sept. of the same year.

FERDINAND III., grand duke of Tuscany, and archduke of Austria, was b. at Florence, 6th May, 1769. In 1790, he succeeded his father, Leopold II., in the government of Tuscany, when the latter obtained the imperial throne at the death of the emperor Joseph II., Leopold's brother. F.'s rule in Tuscany was one of combined mildness and ability; and during his reign were inaugurated many judicial, economical, and legislative reforms: commerce was protected and encouraged; hospitals and asylums founded, good roads opened through the state, and the greatest attention bestowed on the welfare of his subjects, which an enlightened and good prince could exercise. A lover of peaceful progress, he remained strictly neutral in the first coalition against France, and was the first sovereign in Europe to recognize and treat diplomatically with the French republic in 1792. In 1793, intimidated by the combined menaces of the Russian and British cabinets, F. was constrained to relinquish his neutral policy, and become a passive member of the coalition formed by the above governments against France. In 1795, on the French occupation of Piedmont, he speedily reassumed friendly relations with France. In 1797, in order to save his states from annexation to the Cisalpine republic, F. concluded a treaty with Bonaparte on most unfavorable terms; undertaking to pay a war-levy to France, and to transfer to the museum of Paris some of the chief master-pieces of the Florentine galleries, including the "Venus de' Medici." Owing to the continued intrigues of France in his states, F. was forced to seek an Austrian alliance, which furnished Bonaparte with a pretext for declaring war simultaneously against Austria and Tuscany. In 1799, F. retired to Vienna, leaving the French troops in occupation of Tuscany. In 1801, at the peace of Lunéville, he was forced to renounce all claim on Tuscany. In 1814, the peace of Paris reinstated him in Tuscany, and even restored his artistic treasures. He died 17th June, 1824, leaving his states to his son Leopold II.

FERENTI'NO, a t. of Central Italy, in the province of Rome, and about 50 m. s.e. of the city of Rome. Portions of the ancient walls, built in the cyclopean style of large irregular and polygonal blocks of limestone, and patched or surmounted with Roman

masonry, no mortar having been used, are still extant. F. is the ancient Ferentinum, a city of the Hernici. Pop. 10,200.

FERGHANA, a province of Russian Turkestan, comprising a valley surrounded on three sides by the w. ranges of the Thian Shan mountains; pop. '70, 900,000, of whom one third are nomads. The productions are wheat, rice, maize, sorghum, millet, cotton, tobacco, madder, etc. The climate is equable and generally healthy. Rock salt, naphtha, gypsum, iron, lead, coal, and sulphur are found. The Russians have divided the province into seven districts. The affairs of the nomads are managed by their own elders.

FERGUSON, ADAM, a Scottish philosopher and historian, was born (1724) at Logierait, Perthshire, where his father was parish minister. He studied at the universities of St. Andrews and Edinburgh, and was appointed (1744) chaplain to the 42d regiment, in which capacity he was present at the battle of Fontenoy, and is said to have charged the enemy sword in hand, among the foremost of the regiment. In 1757, he succeeded David Hume as keeper of the advocates' library in Edinburgh. He was next appointed professor in the Edinburgh university, first of natural philosophy, in 1759, and subsequently (1764), of moral philosophy—a subject which had always had great attractions for him. While holding this office, he accompanied the young earl of Chesterfield (1774) on his travels on the continent; and in 1778–79, he acted as secretary to the commission sent out by lord North to try to arrange the disputes between the North American colonies and the mother country. The state of his health induced him, in 1784, to resign his professorship, in which he was succeeded by Dugald Stewart. In 1793, he visited various parts of the continent; and on his return, took up his residence for some time at Neidpath castle, in Tweeddale, and latterly in St. Andrews, where he died, 22d Feb., 1816. His chief works are—*Essay on the History of Civil Society* (Lond. 1767); *Institutes of Moral Philosophy* (Lond. 1769); *History of the Progress and Termination of the Roman Republic* (Lond. 1783); and *Principles of Moral and Political Science* (Lond. 1792). The work by which he is best known is his *History of the Roman Republic;* this, together with the essay and institutes, have gone through a number of editions. All his works have been translated into German and French, and the institutes has been used as a text-book in several foreign universities. F. was distinguished for the decision and manliness of his character.

FERGUSON, JAMES, was b. (1710) near Keith, a village in Banffshire, Scotland. His father being a poor day-laborer, he enjoyed only three months of instruction at school, and his subsequent acquirements were the result of his own insatiable thirst for knowledge. His tastes lay principally for practical mechanics and astronomy; and while keeping sheep, to which he was early sent, he was constantly employed in making models of mills, etc., and at night in studying the stars. After working at various country employments, he took to drawing patterns for ladies' dresses, and copying pictures and prints with pen and ink. He then supported himself and his parents by drawing portraits, first in Edinburgh, and afterwards (1743) in London; his leisure time being all the while given to astronomical pursuits. In 1748, he began lecturing on astronomy and mechanics with great acceptance. He was elected a fellow of the royal society in 1763, and received from George III. a pension of £50. He now gave up portraits, and devoted himself to lecturing and writing on his favorite subjects. He died in 1776. F. was held in high esteem for the worth and amiability of his character, as well as for his extraordinary and self-taught acquirements. Few men have done more to promote a knowledge of the results of science, among those who have not the advantage of regular scientific training. His principal works are *Astronomy explained upon Sir Isaac Newton's Principles* (1756; sir David Brewster's ed., 2 vols., 1811); *Lectures on Mechanics, Hydrostatics, Pneumatics, and Optics* (1760); also edited by sir David Brewster in 1805; and *Select Mechanical Exercises*, with an autobiography (1773).

FERGUSON, JAMES, 1797–1867; b. Scotland; came to New York in 1800. He was one of the engineers who laid out the Erie canal, and in 1819–22, assistant surveyor in the boundary commission under the treaty of Ghent; and astronomical surveyor for that commission in 1822–27. He became first assistant of the U. S. coast survey in 1833, and in 1847, assistant astronomer of the U. S. naval observatory. He discovered the following asteroids: Euphrosyne in Sept., 1854; Virginia in 1857; Echo in 1860, for which he was awarded the astronomical prize medal by the academy of sciences of France. He was contributor to Dr. Gould's *Astronomical Journal* and to the *Astronomische Nachrichten;* also to the Episcopal *Church Review*, to the *Merchants' Magazine*, and to other standard publications.

FERGUSSON, JAMES, b. Scotland, 1808; educated in Edinburgh and in England, and went into business in India. This he soon gave up and journeyed through various parts of the east, chiefly with a view of studying the styles of architecture. One of the first results of his studies was *Illustrations of the Rock-cut Temples of India.* He also published *Picturesque Illustrations of Ancient Architecture in Hindustan; Essay on the Ancient Topography of Jerusalem;* and a *Historical Inquiry into the True Principles of Art, more especially with reference to Architecture.* This volume is the first of a projected work in three parts, comprising a universal compendium of past art—Hindu, Mohammedan,

Gothic, etc. The materials collected for this work were used in his *Handbook of Architecture*, published in 1855. Later he issued an *Essay on a Proposed New System of Fortification*, by earthwork. A pamphlet of practical suggestions for the improvement of the British museum and of the national gallery was followed by a "New Design" for the latter at the academy exhibition of 1850. He is also the author of *The Palaces of Nineveh and Persepolis Restored*, published in 1851, and was the architect of the Nineveh court in the crystal palace, Sydenham. Since 1859, he has been one of the royal commissioners to inquire into the defenses of the United Kingdom. In 1862, Mr. Fergusson published a *History of the Modern Styles of Architecture* as a sequel to the handbook, and in 1865 remodeled the whole, and published it as *A History of Ancient and Modern Architecture*, in 3 vols. In addition to these works, he published, in 1868, *Tree and Serpent Worship*, with upwards of 100 plates and illustrations. In 1871, he received the royal gold medal, annually awarded to an eminent architect, or writer on architecture. His latest work is entitled *The Temples of the Jews and the other Buildings in the Haram Area at Jerusalem.*

FERGUSSON, ROBERT, a Scottish poet, was b. at Edinburgh on the 17th Oct., 1751, and received his education at the university of St. Andrews, where he was in possession of a bursary founded by a person of his own name, and resided four years. Subsequently, he removed to Edinburgh, and was employed in the office of the commissary clerk. His poems were chiefly contributed to *Ruddiman's Weekly Magazine*, and gained him considerable local reputation. Unhappily, this reputation proved his ruin. His society was eagerly sought; and in that convivial time, he was led into excesses which permanently ended his health. He fell into a religious melancholy, and finally, through an accidental fracture of the skull, became totally deranged. He died on the 16th Oct., 1774, at the age of 23. His poems were published in 1773.

F.'s poems are distinguished by considerable humor, fancy, and purity of language, and he possessed great mastery over lowland Scotch. He sketches with liveliness contemporary life and incidents, and much of our knowledge of old Edinburgh is derived from his verses. His fame, however, rests quite as much upon his unhappy life and early death, and upon the circumstance that he was to some extent the forerunner of Burns, as upon the essential merits of his verse. Burns admired his works, was indebted to them for hints, called him "his elder brother in the muses," and when he came to Edinburgh, erected a memorial-stone over his grave.

FERGUSSON, Sir WILLIAM, 1808–77; a Scotch surgeon, educated in Edinburgh university. At the age of 20 he became a licentiate of the college of surgeons, and in the following year a fellow. In 1836, he was surgeon to the royal infirmary, and in 1840, professor of surgery in King's college, London. In 1849, he was appointed surgeon-in-ordinary to the prince consort, and in 1860, sergeant-surgeon to the queen. He was celebrated for self-possession in critical circumstances, attention to details, and refinement of touch; and relied more on his mechanical dexterity than on complicated instruments.

FERIÆ (Lat.), holidays during which political and legal transactions were suspended in ancient Rome, and slaves enjoyed a cessation from labor. F. were thus *dies nefasti*, the opposite of the *dies fasti*. See FASTI. Days which were consecrated to a particular divinity, on which any public ceremony was celebrated, and the like, were feriæ. In contradistinction to these, which were *F. publicæ* (public holidays), there were *F. privatæ*, which were observed by single families, in commemoration of some particular occurrence of importance to them or their ancestors. Birthdays, days of purification after a funeral, etc., were also observed as family feriæ. The public F. were divided into those which were always kept (*stativæ*) on certain days marked in the calendar; and those which were kept by command of the consuls or other superior magistrates on the occasion of any public emergency. "The manner in which all public F. were kept bears great analogy to our Sunday. The people generally visited the temples of the gods, and offered up their prayers and sacrifices. The most serious and solemn seem to have been the *F. imperativæ;* all the others were generally attended by rejoicings and feasting." See an elaborate article by Dr. Schmitz in Smith's *Dictionary of Greek and Roman Antiquities.* In Scotland, those days during which it was not lawful for courts to be held, execution to proceed, or any other judicial step to be taken, used to be called *feriat* times, but the expression is obsolete.

FERID-EDDIN-ATHAR, or FARID-UDDIN-ATTAR, 1119–1229; a Persian poet and mystic, who died at the age of 110 years. He was Mohammed ben Ibrahim, the son of a druggist, and brought up to his father's business. "Ferid-Eddin" was an honorary title, signifying "pearl of religion." To this he added "athar" (which means "druggist"), and so quite changed the real name. He studied the mystic philosophy of the Sufis, and was recognized as one of its principal representatives. He was a voluminous writer, leaving no fewer than 120,000 couplets of poetry. His most famous work is the *Mantic Uttair*, or language of birds, an allegorical poem containing a complete survey of the life and doctrines of the Sufis. According to the poet, the birds, weary of a republic, longed for a king. As the lapwing, having guided Solomon through the desert, best knew what a king should be, he is asked whom they shall choose. "The Simorg in the Caucasus," is his reply. But the way to the Caucasus is long and dan-

gerous, and most of the birds excuse themselves from the journey. A few, however, set out; but by the time they reach the great king's court, their number is reduced to 30. The 30 birds, wing-weary and hunger-stricken, at length gain access to their chosen monarch, the Simorg; but only to find that they strangely lose their identity in his presence—that they are he, and he is they. In such strange fashion did the Persian poet image forth the search of the human soul after God, and its absorption into the divine.

FERISH'TA, MOHAMMED KASIM, a Persian historian, author of a history of India, reputed to be one of the most trustworthy of oriental historians. He gives a brief history of the country prior to the Mohammedan conquest, and of the victorious progress of the Arabs through the east; following with a history of the kings of some of the provinces, of the Mussulmans of Malabar, the Mussulman saints of India, and the geography and climate of the country.

FERMANAGH, an inland co. in the s.w. of the province of Ulster, Ireland. It is 45 m. long, and 29 broad; area, 714 sq.m.—$\frac{3}{5}$ arable, $\frac{1}{16}$ in wood, and above $\frac{1}{4}$ in water, including upper and lower lough Erne, and the smaller lakes, Melvin and Macnean. The surface is mostly a succession of mountains and hills, and the scenery varies. The chief rocks are limestone, with many cavities and underground watercourses, millstone grit, and old red sandstone. Some coal, iron, and marble occur. The chief rivers are the Erne and its tributaries, the Colebrooke, Woodford, and Arney. The soil in the low grounds is a deep rich loam, but in the limestone and sandstone districts it is cold and thin. The climate is mild and moist. Marsh-fever prevails in summer and autumn near lough Erne. In 1877, 107,323 acres were in crop; oats, barley, wheat, potatoes, turnips, and hay being the chief products. The chief exports are oats, butter, and eggs. F. is divided into 8 baronies and 23 parishes. It returns two members to parliament. Principal towns: Enniskillen, Lisnaskea, and Lowtherstown. Pop. '51, 116,047; '61, 105,373; '71, 92,688, of whom 51,736 were Roman Catholics, 35,549 Episcopalians, and 1755 Presbyterians. A little coarse linen is manufactured in the county. In 1876, there were 16,640 pupils attending the national schools of Fermanagh. The chief antiquities are raths or rude hill-forts, and some ecclesiastical ruins.

FERMAT, PIERRE DE, a French mathematician, was b. at Toulouse in 1590, and at an early period, in conjunction with his friend Pascal, hit upon a very ingenious mode of considering figurate numbers, upon which he subsequently based his doctrine of the calculation of probabilities. F. employed himself greatly with the properties of numbers, and made many acute discoveries in regard to their composition and analysis. He also squared the parabola in a much simpler way than Archimedes at an earlier period had done, and made many other discoveries in geometry. His method of finding the greatest and least ordinates of curved lines was analogous to the method of the then unknown differential calculus. In addition to his scientific attainments, F. possessed an extraordinary knowledge of ancient and modern languages. He died at Toulouse in 1665. A collection of F.'s works appeared at Paris in 1679.

FERMATA, in music, is the name given to a pause, or resting-point, generally marked by the sign ⌒. The notes over which this sign is placed are prolonged beyond their true length. The F. is frequently found near the end of a part of a composition, which affords an opportunity for the singer or player to introduce an extempore embellishment.

FERMENTATION is the term applied to the change which occurs in one organic substance when influenced by another in a state of decay or putrefaction. The process was originally understood to include all the changes which matter of plant and animal origin undergoes when disunited from the living force, but is now restricted to certain of the changes. Thus, there are many substances, such as starch and sugar, which have no power of themselves to pass into decay, or change in composition through lengthened periods of time; whilst there is another class of substances, including albumen, fibrin, and caseine, as well as gelatinous tissues, mucus, etc., which, when exposed to moderately heated air in a moist condition, more or less rapidly begin to putrefy or decompose. The latter substances, viz., those which spontaneously pass into a state of change, are called *ferments*, and when they are brought into contact with sugar, etc., which otherwise would not be altered, they cause the latter to be broken up into simpler compounds; it is this process that constitutes fermentation. The ferment is always a body which has the power of rotting or becoming putrid, and is actually in a state of decomposition. Every substance which is liable to putrefy becomes, while putrefying, a ferment; and in this condition acquires the property of setting agoing the process of F. in any second body capable of it, and retains the power till it is so far decomposed that the putrescence is over. The ferments are very widely distributed in organic matter, and hence, whenever a plant or an animal dies, the process of F. proceeds more or less rapidly. The most important kind of F. is that known under the designation of *vinous*, and which forms part of the processes in the preparation of alcohol, beer, wine, etc. It consists in the action of a peculiar ferment called yeast (q.v.) upon a saccharine

liquid, when the sugar ($C_{12}H_{14}O_{14}$) is decomposed into two atoms of alcohol (each $C_4H_6O_2$), four atoms of carbonic acid (each CO_2), and two atoms of water (each HO). In this change it will be observed that the yeast, whilst it causes the change, does not unite directly or indirectly with any of the constituents of the sugar. The vinous F. proceeds best at a temperature ranging from 60° to 80° F., the mean and more desirable being about 70° F. The process itself causes the development of heat, and recourse must be had, therefore, to large airy rooms, where the fermenting tuns or vessels are arranged, and also to the circulation of cold water in pipes distributed round the interior of the vessels, and in contact with the liquid. See BEER.

The *lactic acid* F. takes place in milk when it begins to sour. The caseine of the milk acts the part of the ferment, and it causes the change in the sugar of milk, which is in part resolved into lactic acid ($C_6H_5O_5 + HO$). The latter then curdles the caseine, and the milk besomes clotted. When the milk still further sours, and the material is kept at a temperature of 77° to 86° F., the *butyric acid* fermentation takes place, in which the putrefying caseine changes the sugar (q.v.) of milk into butyric acid ($C_8H_7O_3 + HO$).

The *viscous* or *mucus* F. occurs when the juice of the beet-root, dandelion, ash-tree, etc., is allowed to decompose at a temperature of 90° to 100° F., when the albuminous matter present causes the sugar to ferment into lactic acid, mannite, a gummy substance, some alcohol, and various gases. The same kind of F. occurs when boiled yeast or boiled gluten is added to ordinary sugar.

The remaining processes of F. are the *benzoic* F., yielding, amongst other matters, the essential oil of bitter almonds (q.v); the *sinapic* F., which occurs in mustard when moistened with water, and during which the pungent oil of mustard is developed; and the *acetous* F., which is, however, not a true instance of F., as the oxygen of the air is required to complete the change. See ACETIC ACID.

FERMENTATION (*ante*), a chemical term originally applied to natural processes in which bubbles of air seem to be generated, producing what is called effervescence. Effervescence is, however, only a phenomenon which accompanies one of the most familiar instances of fermentation, and does not exist in all its forms. The commonest examples of fermentation are: the change of the juices of fruits to wine, cider, etc.; the souring of milk; and the putrefaction of animal or vegetable matter. As these changes occur without any notably exciting cause, they have been thought to be spontaneous; but no such thing as simple spontaneity exists in the case. On the contrary, experiment shows that no fermentable chemical species will ferment except it is in the presence of water, and is kept by that water in contact with some specific substance which by its presence excites and maintains the chemical activity of the kind in question. The substance which is thus the occasion of the chemical action is called a ferment. Even the simple fact of presence is not deemed to be enough. The ferment must itself change, but the cycle of change may cause a continuous reproduction of the agency, and thus result in the continuity of the fermentation.

Vinous fermentation may be selected for illustration, as one which is familiar in some of its many illustrations, such as the making of wine from grapes and currants, cider from apples, beer from grain, etc. The juice of grapes is an intensely sweet yellowish liquid, which may be made perfectly limpid and transparent by filtration through bibulous paper. If thus clarified, it will remain unchanged indefinitely; but if to it be added even a small quantity of the unclarified juice, fermentation will ultimately begin, and the liquid will become turbid. A finely divided substance is formed in the liquor, which rises to the surface as a scum, and is called yeast. The production of yeast is accompanied by the evolution of carbonic acid, which also comes to the surface, and is retained in bubbles by the viscous nature of the scum. The chemical change once begun becomes accumulatively more active in the presence of the increasing volume of yeast, until it reaches a climax, and then it dies away because the whole substance has been acted upon. The yeast settles to the bottom; a clear liquid remains, whose sweetness has given place to a vinous taste; from which it appears that the sugar has vanished, and instead, a new, volatile, inflammable substance called alcohol is present. The temperature of vaporization being lower for alcohol than for water, it may be driven off by processes of distillation, each repetition furnishing a greater proportion of alcohol, and may finally be obtained in a pure, or "absolute," form, when treated with some chemical which takes away the remnant of the water. It appears then that the vinous fermentation has occasioned a change in which sugar has given place to alcohol. The analytical statement of this change is expressed by Gay Lussac's formula, substantially, but not critically. He assigned to grape sugar the simple formula CH_2O, and for the reaction gives the equation—

$$\underset{\text{Sugar.}}{6(CH_2O)} = \underset{\text{Alcohol.}}{C_6H_{12}O_2} = \underset{\text{Carbonic Acid.}}{2C_2H_6O} + 2CO_2$$

or, 45 units of sugar give 23 units of alcohol and 22 of carbonic acid. Cane sugar has the formula, $C_{12}H_{22}O_{11} = 2(C_6H_{12}O_6) - H_2O$, or, two equivalents of grape sugar with one at w[illegible] It appears, on further investigation, that certain other compounds are formed

—thus 100 parts of cane sugar become, by absorption of water, 105.4 parts of glucose, which yield approximately—

Alcohol	51.1
Carbonic acid	49.4
Succinic acid	0.7
Glycerine	3.2
Matter passing to yeast	1.0
Total	105.4

even this does not account for the formation of a small quantity of fusel-oil, and some ethers.

Vinous fermentation is induced by *saccharomyces*, a genus of fungi, consisting of minute cells, sometimes isolated, sometimes grouped, but never forming a continuous tissue. Of the several species, *S. cerevisiæ*, the fungus of common yeast, used in making beer, is most important. Its cells have a diameter of about $\frac{1}{100}$ millimeter. Of the genesis of the yeast plant little is known. Its germs abound in harvest time about the vines and stalks of the grape, and in breweries and wine-cellars, but they are by no means generally diffused through the air.

The change in lactic fermentation is expressed by the equation—

Hydrated milk sugar. Lactic acid.

$$C_{12}H_{22}O_{11}+H_2O = 4C_2H_6O_3$$

Ordinary glucose dissolved in milk ferments to lactic acid, with the milk sugar, up to a certain maximum of acidity, when the change stops. Chalk or carbonate of soda neutralizes a part of the acid, and revives the fermentation. The agent of this fermentation is a microscopic fungus, consisting of single cells, much smaller than those of the brewers' yeast. Lactic ferment sometimes annoys brewers as an impurity in their yeast. The lactic ferment is not chargeable as the agent which ordinarily sours milk; this result is caused by a motionless bacterium which Lister calls *B. lactis*. Yet this bacterium, if made to pass through a certain round of changes, also produces lactic fermentation. The germs of this bacterium are thought to abound in the air of dairies and cow-stables, but are not generally diffused through the air.

Butyric fermentation is a change which occurs in milk or cheese, in which the lactic acid is broken up, as shown by the equation—

Lactic acid. Butyric. Carb. acid. Hydrogen.

$$2C_3H_6O_3 = C_4H_8O_2 + 2CO_2 + 2H_2$$

It is caused by the presence of an animalcule called a *vibrio*. This fermentation is one of a series of fermentations called putrefaction, of which the chemical reactions are very intricate. The agents are, with scarcely an exception, bacteria and vibrios.

FERMENTED AND DISTILLED LIQUORS, STATISTICS OF. Under the headings, BEER, SPIRIT, and WINE, will be found particulars as to the history, manufacture, etc., of these liquors. All that is contemplated in the present article, is a statement of the quantities manufactured and consumed in the United Kingdom of Great Britain and Ireland. In 1801, the consumption of spirits, British, colonial, and foreign, in the United Kingdom was 8,800,840 gallons. In fifty years, it had considerably more than trebled, having risen in 1851 to 28,760,224 gallons. In the same time, the population had risen from 15,506,794 to 27,452,262. In the former period, therefore, the consumption was at the rate of little more than half a gallon per head, while in the latter period it amounted to more than a gallon. There would seem, however, to have been something exceptional in the year 1801 to reduce the consumption to the low point we have mentioned, as in the previous year, the consumption was nearly 12 million gallons, and in the succeeding year, more than 15½ million gallons; and in no subsequent year did it fall so low as in 1801. The consumption at the two periods was divided over the three countries as follows: England, 1801, 6,150,983 gallons—namely, 2,555,920 British; 1,687,839 colonial; and 1,907,224 foreign. In 1851, 13,916,313 gallons—namely, 9,595,368 British; 2,542,395 colonial; and 1,778,550 foreign. In the former period, the consumption of each individual was less than three fourths of a gallon; in the latter, nearly seven ninths of a gallon. Scotland, 1801, 930,490—namely, British, 295,931; colonial, 349,237; and foreign, 285,322. 1851, 7,090,894—namely, British, 6,830,710; colonial, 179,883; and foreign, 80,301. The consumption per head in Scotland in 1801 was thus only three fifths of a gallon, while in 1851 it was 2⅝ gallons. Ireland, 1801, 1,719,367—namely, British, 355,106; colonial, 1,057,316; foreign, 306,945. 1851, 7,753,017—namely, British, 7,550,518; colonial, 158,147; foreign, 44,352. In the former period, the consumption per head was two thirds of a gallon; in the latter, about 1⅛ gallon. But there is every reason to believe, that the consumption in 1801 was much larger in the United Kingdom generally than the statistics indicate. Between the periods we have mentioned, the duty on British spirits varied considerably. In England, in 1802, it was 5*s.* 4½*d.* per gallon; in 1819, it had risen to 11*s.* 8½*d.*; and in 1851, it stood at 7*s.* 10*d.* In Scotland, in 1802, the duty was 3*s.* 10½*d.* per gallon; it rose to 9*s.* 4½*d.* in 1815; and in 1851, was 3*s.* 8*d.* In Ireland, in 1802, it was 2*s.* 10½*d.*; in 1815, it had risen to 6*s.* 1½*d.*; in 1851, it stood at

2s. 8d. The duties in the three countries have now been equalized, the sum fixed being at first 8s. per gallon, since raised to 10s., at which it now remains. In 1874, there were manufactured in Great Britain 35,352,232 gallons of proof spirits; imported for home consumption, 10,676,163; exported, 4,697,936: the consumption was therefore 41,330,459 (the pop. being about 32,000,000), or nearly 1¼ gallon to each. Of the total number of gallons of proof-spirits distilled in the United Kingdom in 1874 (35,352,232), there were 9,670,525 in England; 16,300,161 in Scotland; and 9,381,546 in Ireland. The number of gallons on which duty was paid in the United Kingdom in 1874 was 30,690,051, the duty amounting to £15,345,027. Of this sum, £6,741,037 was paid in England, £4,661,098 in Scotland, and £3,942,890 in Ireland. The number of gallons on which duty was paid in 1875-76 was 31,219,402. Of the whisky distilled in Scotland in 1874, 4,247,431 gallons were exported into England, and 851,304 into Ireland; Scotland receiving in return from England 68,977, and from Ireland 205,614. Ireland sent to England 2,682,457 gallons, and got back in return 133,148. Of foreign spirits, there were imported into the United Kingdom in 1874—rum, 8,150,372 gallons, of which 5,193,860 were for home consumption; brandy, 3,378,057 gallons, nearly all being for home consumption; and other sorts, including Geneva, 2,285,112 gallons, 1,178,160 for home consumption.

The quantity of wine entered for consumption in 1802 was 5,449,710 gallons, upon which a duty of £1,723,339 was paid. In 1851, 6,280,653 gallons; duty, £1,776,246. In 1877, 19,568,807 gallons were imported, of which 17,671,120 were retained for home consumption.

The quantity of beer manufactured in Great Britain and Ireland can only be arrived at approximately, the duty being leviable on the malt. The general estimate is, that two bushels of malt produce one barrel, or 36 gallons of beer. In 1874, the quantity of malt brewed in the United Kingdom was 58,728,687 bushels, equal to 29,364,343½ barrels, or 1,057,116,366 gallons of beer. This beer was made chiefly in England, 52,518,830 bushels of malt being consumed there; in Scotland, the quantity used was 2,952,134 bushels; and in Ireland, 3,257,723.

FERMENTED AND DISTILLED LIQUORS, STATISTICS OF (*ante*). An account of the liquor traffic in the United States for the year ending June 30, 1872, based on the internal revenue report for 1872, and the census returns of 1870, shows the following figures:

Number of distilleries	3,132
Number of breweries	3,421
Number of licensed retail dealers	161,144
Number of wholesale dealers	7,276
Sales of retail dealers, est., $5,000 each	$805,720,000
Gallons of distilled liquors produced	69,033,533
Barrels of fermented liquors	8,039,969
Total, imports added, gallons	337,288,066
Total cost	735,720,048

From the official report of the United States internal revenue department for the year ending June 30, 1879, it appears that the revenue derived from distilled liquors in that year was as follows:

Brandy distilled from apples, peaches, or grapes	$919,052 53
Spirits distilled from other materials	46,790,411 30
Rectifiers' special tax	160,123 21
Retail dealers	3,903,036 24
Manufacturers of stills, and stills and worms manufactured	3,525 85
Stamps for distilled spirits for export	17,212 20
Warehouse, rectifiers', and dealers' stamps	292,907 90
Interest on tax upon spirits	74,899 48
Total revenue from distilled spirits, year ending June 30, 1879	52,570,284 69
Revenue in the same year from fermented liquors	10,729,320 08
Total revenue from both kinds	63,299,604 77

The *National Temperance Almanac* for 1880 says: The select committee of the British house of lords lately made a report in which it was stated that the amount expended in that country for intoxicating liquors rose from £84,222,171 in 1860, to £147,288,759 in 1876. The consumption of alcohol as a beverage rose from about four gallons per head in 1856 to nearly double that sum in 1875. From other sources it is learned that in the year ending Sept. 30, 1878, licenses were issued in the United Kingdom to 2,641 common brewers, not licensed to sell beer by retail; to 99,337 victualers; to 28,453 keepers of houses where beer may be drunk on the premises, and 6,691 where beer may not be consumed on the premises. Licenses were also granted to 14,948 victualers and 7,158 keepers of beer-houses who brew their own beer. The quantity of malt consumed by common brewers during the year was 50,362,815 bushels; by victualers, 6,704,340 bushels; by persons licensed to sell beer to be drunk on the premises, 2,868,767 bushels; and by persons licensed to sell beer not to be drunk on the premises, 594,083 bushels. During the year ending on the 31st Dec., 1879, 58,543,252 bushels of malt were made in

the United Kingdom, and the duty charged amounted to £7,939,099. The total amount realized for brewers' licenses was £411,831, and the declared value of beer exported from the United Kingdom was £1,918,886.

FERMENTED LIQUORS are alcoholic beverages made by fermentation of saccharine fluids and juices; the principal being the different kinds of *ale* or *beer*, made by fermentation of an infusion of malt, chiefly of barley, but also sometimes of other kinds of grain; and *wine*, made by fermentation of grape-juice. *Cider* is made by fermentation of the juice of apples; *perry*, of that of pears; *palm-wine*, by fermentation of the sap of different kinds of palm. Fermented liquors, commonly called wines, are also made from the juice of various kinds of fruit, as currant wine from that of the red currant; and from the juice of some roots, as parsnip wine from that of the parsnip, etc. The sap of the American aloe, or *agave* (q.v.), yields the fermented liquor called *pulque*, much used in Mexico. A wine is made from the sap of the birch, and that of some other trees is used for a similar purpose. *Mead* is a fermented liquor made from honey. From every fermented liquor, a kind of *spirit* may be obtained by distillation.

FERMO, a t. of Italy, in the province of Ascoli Piceno, is situated on a rocky height 4 m. from the Adriatic, and 32 m. s.s.e. of Ancona. It is well-built and fortified, surrounded with walls and ditches, is the seat of an archbishop, and has a cathedral and an elegant theater. Formerly F. possessed a university. It has some trade in corn and wool. Pop. 15,682. In the immediate vicinity are the ruins of the ancient Firmum, whose name F. inherits. Firmum had been a Roman colony from the year 264 B.C.

FERMOY, a t. in the e. of Cork county, Ireland, chiefly on the right bank of the Blackwater, 19 m. n.e. of Cork city. Its origin dates from the 12th c., when it was the seat of a great Cistercian abbey; but its present importance, which commenced in the end of last century, is due to Mr. (afterwards sir John) Anderson, who introduced mail-coaches into Munster. The hills to the s. of the town rise in Knockinskeagh 1388 feet. F. is handsomely built and regularly laid out. A large ecclesiastical establishment (Roman Catholic), consisting of a church, a bishop's house, two convents with large schools, and a college with nearly 100 students, has recently been erected on a hill rising from the Blackwater. A bridge of 13 arches, built in 1689, crosses the river. Infantry and cavalry barracks for 3,000 men stand on the left bank of the river, and command the approach to Cork. F. has a trade in agricultural produce. Pop. '61, 8,705; in '71, 7,611. The town-rates in 1871 were £341.

FERN, FANNY. See PARTON, JAMES.

FERN, MALE, a name given, in consequence of an erroneous notion, long since exploded, to a fern very common in the woods of Britain and of the continent of Europe, the *aspidium filix mas* of some botanists, and *lastræa filix mas* and *nephrodium filix mas* of others. The fronds are bipinnate; the pinnules oblong, obtuse, and serrated; the sori near the central nerve, orbicular, kidney-shaped, and fixed by the sinus; the stipes and rachis chaffy. If not one of the very finest of our ferns, it is certainly a chief ornament of many of our woods, and a plant of very considerable beauty. The subterranean stem (rhizome) is officinal. It is about a foot long and of the thickness of a quill, almost inodorous, with a nauseous sweet taste, becoming astringent and bitter. It was anciently used as an anthelmintic, and its use has been revived, especially in cases of tapeworm, in which it is believed to be very efficacious. Its anthelmintic powers are due to a thick, almost black volatile oil which it contains, and which is now itself also used in medicine.

FERN, SWEET, *Comptonia asplenifolia*, a shrub of the natural order *amentaceæ*, suborder *myriceæ*, a native of the mountain-woods of North America, forming a small bush with linear pinnatifid, fern-like leaves. Its leaves have a powerful aromatic fragrance when rubbed. It is tonic and astringent, and is much used in the United States as a domestic remedy for diarrhea.

FERNANDEZ, JUAN, a Spanish discoverer. While sailing along the coast of South America early in the 16th c., he found that the winds near the shore were almost constantly from the s., and that they greatly retarded his progress. Standing off shore he met the trade-winds which blew from a different direction, and made a voyage so remarkable for its short time that he was, on returning to Spain, arrested on a charge of sorcery. By some unusual leniency, however, his explanation was accepted and he was acquitted. During one of his voyages, 1563, he discovered the islands which now bear his name. See JUAN FERNANDEZ, *ante*. He was so pleased with their fertility and beauty, that he asked for their possession, and the Spanish government gave them to him in 1572. A colony was established, but it was not permanent, and the only relic of it is the goats, which have continued to thrive ever since. In 1574, he discovered the islands of St. Ambrose and St. Felix. His companions during a voyage made in 1576 say that he saw a large island or continent in the southern ocean. This, if not an illusion, may have been New Zealand, or Australia.

FERNANDINA, port of entry and seat of justice in Nassau co., Fla., on Amelia island, Atlantic coast, at the e. end of the Atlantic, Gulf, and West India Transit railroad, which runs across Florida in a s.w. direction to Cedar Keys, on the gulf of Mexico;

pop. about 2,500. It has an excellent harbor, considerable trade, and some manufactories. It is the seat of a Roman Catholic seminary. In the winter it is a place of resort for people from the north seeking a milder climate.

FERNANDO DE NORONHA, a lonely island of the southern Atlantic, in lat. 3° 50′ s., and long. 32° 25′ w., about 125 m. from the coast of Brazil, to which empire it belongs. It is about 8 m. in length. The surface is rugged, and rises into a peak about 1000 ft. high, the upper part of which is very steep, and on one side somewhat overhanging. The island is mostly covered with wood; but as little rain falls, there is not much of tropical luxuriance. It is used as a place of banishment for Brazilian criminals. No woman is allowed to land on the island. Pop. 2,000, half of whom are convicts, who cultivate small farms.

FERNANDO PO, an island on the w. coast of Africa, in the bight of Biafra, is situated about 20 m. from the nearest point on the shore, and is about 44 m. long and 20 m. broad. The appearance of this island from the sea is exceedingly picturesque and beautiful. It is traversed by a mountain ridge, which, in Clarence peak, rises to the height of 10,650 ft., and is fertile, well watered, and in many parts thickly wooded. Besides swarms of monkeys, some of which are of great size, the island contains many goats and sheep in a state of nature. The climate, always excessively hot, is rendered more intolerable during the rainy season by a pestilential wind from the continent. The native population, who are of negro race, are said to amount to from 10,000 to 12,000 in number, and to inhabit fifteen villages. The English, with the consent of Spain, into whose hands F. P. had fallen, made an attempt in 1827 to form a settlement on the island, but abandoned it in 1834. In 1844, it was again taken possession of by Spain. The colony has a population of about 900, most of whom are liberated Africans.

FERNAN-NUNEZ, a small t. of Spain, in the province of Cordova, and 10 m. s. of the town of that name. It has some linen and woolen manufactures. Pop. 5,500.

FERNS, *Filices*, an order of acrogenous or cryptogamous plants, divided by some botanists into several orders; whilst some make *filices* a sub-class, and include in it *lycopodiaceæ*, *marsileaceæ*, and *equisetaceæ*. See these heads. F. are either herbaceous perennial plants, or more rarely trees, the root-stock or the stem producing leaf-like *fronds* (often called leaves), which are sometimes simple, sometimes pinnated, or otherwise compound, exhibit great variety of form, and are generally coiled up (*circinate*) in bud. The fronds are traversed by veins, generally of uniform thickness, which are simple or forked, or netted, sometimes produced from the sides of a midrib or primary vein, sometimes from a primary vein on one side, sometimes radiating from the base of a frond or segment of a frond. The fructification takes place either on the lower surface or on the margin of the fronds, and arises from the veins. The spores are contained in capsules or spore-cases (*thecæ*, *sporangia*), which are often surrounded with an elastic ring, and are either naked or covered with a membrane (*involucre* or *indusium*), and are generally clustered in round or elongated or kidney shaped masses (*sori*). The margin of the frond is sometimes folded so as to cover the spore-cases, and sometimes, as in the flowering fern (*osmunda*) (q.v.), the fertile part of the frond is so transformed that its leaf-like character entirely disappears, and it becomes a spike or panicle. The spore-cases burst at their circumference, or longitudinally, or irregularly. Moving spiral filaments exist in F., but their functions in connection with reproduction are not well known. The reproduction of F. has been the subject of much investigation and discussion, and supposed discoveries of sexual organs have been announced, but satisfactory evidence of their nature has not been obtained.—The number of known species of F. is about 2,500. They are found in all parts of the world, but are fewer towards the poles than within the tropics, and fewer in continental than in maritime countries, abounding exceedingly in mountainous tropical islands, as in Jamaica. Many of them delight in moisture and shade, although some are found in the most exposed situations. Some of them resemble mosses in size and appearance; whilst tree ferns (q.v.) resemble palms, and sometimes attain a height of 40 feet. A few are climbers. One climbing species (*lygodium palmatum*) is found in North America as far n. as Boston.—F. are divided into *polypodieæ*, *hymenophylleæ*, *gleicheniæ*, *schizææ*, *osmundeæ*, *daneæ*, and *ophioglosseæ*, of which sub-orders (or orders) the first, second, fifth, and seventh alone contain British species, and the first contains a great majority of all ferns.—The root-stocks of some F. contain so much starch that they are either used as food, or food is prepared from them, particularly those of the tara (q.v.) F. in New Zealand and Van Diemen's Land, and those of *aspidium* (or *nephrodium*) *esculentum* in Sikkim and Nepal; also the stems of some of the tree-ferns, as of *cyathea medullaris* in New Zealand, and *alsophila spinulosa* in India. The young and tender fronds of some F. are occasionally used as pot-herbs in the Highlands of Scotland, Norway, the Himalaya, etc. The fronds are generally mucilaginous, slightly aromatic and astringent. Those of some species of maidenhair (q.v.) are used for making *capillaire;* whilst the bitter and astringent root-stocks of some F. are occasionally used in medicine, as those of the male fern (see FERN, MALE) and the Peruvian *polypodium caliguala*, particularly as anthelmintics. The fronds of a few species are delightfully fragrant.—The cultivation of F. is now in many places successfully conducted on a somewhat extensive scale, both in the open air and in hot-houses; and to such an extent has the occupation of fern-collecting reached, that many excellent

treatises on this subject alone have been written and elaborately illustrated. Amongst others, we may mention *British Ferns* (1s.), published by Routledge, London, as an excellent handbook, while the magnificent nature-printed work, published 2 vols., royal 8vo, by Henry Bradbury, supplies all needful information. Wardian cases, filled with them, have also become common, and are most pleasing ornaments of apartments. The principal species will be noticed under their particular heads.

FERNS (*ante*), a group of cryptogamous or flowerless plants, much prized for their beauty, of which more than 2,500 species have been described by botanists. They formed a prominent feature in the vegetation of the early geological ages, and are found at present in every quarter of the globe, being comparatively few and small in cold climates and large and abundant in the tropics. They grow from a woody stem that first creeps along or under the ground, then becomes erect, and sends forth from the sides, or at the top, leaves or fronds of varied and most curious patterns. They vary in size in different climates, from herbaceous perennial plants with a slight stem producing leaves often less than half an inch in length, to trees rising in the tropics to a height of from 50 to 60 ft., and sending out at the top a beautiful crown of fronds from 8 to 20 ft. in length. Ferns are fructified from the lower face or the edges of the fronds, on which are collections of capsules filled with seeds or spores. A spore on germination produces a structure which, compared with its immediate parent, is very small, and bears no resemblance to it in form or texture. It is called the prothallium, and its function is entirely reproductive; it develops sexual organs of two kinds, archegonia and antheridia, either on the same or different prothalia. Hence, in contradistinction to the sporophore—the function of which in this group of plants is purely vegetative—the prothalial generation is termed the oophore. The whole group of ferns (pteridophyta) has been classed as follows:

PTERIDOPHYTA.—Cormophyta with two distinct stages in the life-cycle. Sporophore with high vegetative differentiation. Oophore inconspicuous and destitute of vascular tissue.

Class I. *Filicinæ*.—Leaves highly developed. Sporangia numerous on the fertile leaves.

Sub-class 1. *Filices*.—Leaves without stipular appendages. Sporangia epidermal, containing spores of one kind developed in each from a single primary mother-cell.

Sub-class 2. *Stipulatæ*.—Leaves with stipula-like appendages. Sporangia containing spores of one kind developed in each from many endogenous primary mother-cells.

Class II. *Equisetineæ*.—Leaves rudimentary. Sporangia 5 to 10 on the fertile leaves.

Class III. *Lycopodinæ*.—Leaves small (except isoetes), simple. Sporangia solitary.

Sub-class 1. *Lycopodiaceæ*.—Spores of one kind.

Sub-class 2. *Ligulatæ*.—Spores of two kinds.

FER OLIGISTE is a mineralogical term applied to a variety of anhydrous red oxide of iron (Fe_2O_3), otherwise called *specular iron ore*. The famous Swedish, Russian, and Elba iron are in greater part prepared from this iron ore. The natural position of F. O. is in the primary rocks. See IRON.

FEROZABAD, a t. of India, in the British district of Agra, n.w. provinces, 24 m. e. from Agra. It is the principal place of a pergunnah of the same name. It was formerly named Chandwar, and was a place of much greater importance than at present. Its fine edifices are mostly deserted and in ruins; most of the inhabited houses being cottages thatched with straw. It is surrounded by a wall, outside of which are many mounds and shapeless ruins. Pop. '72, 14,255.

FERO'ZĒ PORE (so called from its founder, Feroze Toghluk, who reigned in Delhi from 1351 to 1388), in the Punjab, stands about 3 m. from the left or s.e. bank of the Sutlej, in lat. 30° 55′ n., and long. 74° 35′ east. At one time, a large and important town, as its massive fortifications and extensive ruins still indicate, it had sunk into poverty and insignificance before it actually came, in 1835, into the possession of the English. Since then, the place has regained much of its former consequence, holding out, with its wide streets and its colonnaded bazaars, the promise of a grand emporium of commerce. Politically, too, F. P. has become prominent under British supremacy, having been a starting-point, whether for war or for negotiation, in many of our dealings with Afghanistan and the Punjab. In connection with this feature in its history, the city contains a monumental church in honor of the memory of those, both privates and officers, who fell in the various conflicts with the Sikhs. The pop. in '68 was 20,592.—The *district* of the same name has an estimated area of 2,696 sq.m., and a pop. '68 of 549,253. It is now in part either barren or covered with jungle, but the ruins of towns and villages indicate that it must have been at one time both more fertile and more populous.

FERO'ZĒ SHAH, a village apparently within the district of Feroze Pore, and situated about 10 m. e.s.e. of the town of that name, is in lat. 30° 52′ n., and long. 74° 50′ e., lying about 12 m. from the left bank of the Sutlej. It claims notice mainly as the scene of the second in order of the four great battles of the first Sikh war. The conflict in question, which lasted two days, took place in Dec., 1845, ending in the rout of the

natives and the capture of their intrenchments. The British army was commanded by sir Hugh Gough and sir Henry Hardinge; and, as in the victory of Mudki, gained only three days before, it sustained heavy loss.

FEROZE SHAH CANAL, a work, including its branches, of 240 m. in length, demands detailed notice as well for its historical interest as for its economical value. It dates back as far as 1356, owing its origin, as well as its name, to Feroze Toghluk, king of Delhi. Viewed as a whole, it leaves the right bank of the Jumna in lat. 30° 19′ n.; and, after sweeping round so as to skirt Sirhind, a territory on the Sutlej, it rejoins its parent stream at Delhi in lat. 28° 39′, thus measuring, in mere difference of latitude, 100 geographical miles. This artifical water-course, intended principally for the purposes of irrigation, seems to be equally creditable to native enterprise and native skill. But, as nothing of the kind appears to be permanent in the east, this noble channel was so much neglected, that, in the beginning of the 17th c., it was cleared out by Vizier Ali Murdan Khan, who, in point of fact, was the first to carry it, through its lower half, back into the Jumna. Finally, the entire line has, during this 19th c., been again repaired and improved by the British government. In the light of repeated drought and famine, the importance of such undertakings as the Feroze Shah canal can scarcely be overrated.

FERRANDI'NA, a t. in the s. of Italy, in the province of Basilicata, stands on a height on the right bank of the Basento, 35 m. e.s.e. of Potenza. Good wine is produced in the neighborhood. Pop. about 6,000.

FERRA'RA, the most northern of the Italian provinces that are washed by the Adriatic. It extends immediately s. of the Po, between the main branch of which, and the Po di Primaro, it is for the most part inclosed. As one of the old delegations, it had an area of 1180 sq.m., with a population amounting to 244,524; but according to the *Statistica Administrativa del Regno d'Italia*, published in 1861, the province had undergone certain modifications, and its pop. was then only 194,161; in 1871, it was 215,369. The area consists, for the most part, of swamp and lake; and many rivers and canals intersect it. Between the Po di Volano and the Po di Primaro, the marshes become very extensive, and receive the name of *Valli di Comaccio*. This province produces great quantities of fish, affords good pastures, and carries on a great trade in corn and hemp. It was at one time a dukedom under the house of Este, but on the failure of a legitimate male heir, pope Clement VIII. wrested it from this family, and annexed it to the states of the church in 1598. It became part of the kingdom of Italy in 1860.

FERRA'RA, an ancient city of Italy, capital of the province of the same name, is situated in a low marshy plain in the delta of the Po, and about 4 m. s. of the main branch of that river, 28 m. n.n.e. of Bologna, and 40 m. n.w. of Ravenna. F. was first made a walled city by the exarch of Ravenna about the close of the 6th c., and in the following century (661 A.D.) became the seat of a bishop. In the middle ages, it was the great commercial emporium of Italy, and the seat of a court renowned throughout Europe; but now the city has a peculiarly deserted and melancholy appearance; grass grows on the pavements of its broad and regular streets, and its churches and palaces are either rapidly falling, or have already fallen into decay. It is surrounded with walls, and is strengthened by bastions and a fortress. The old castle, or ducal palace, once the residence of the dukes of Este, but recently, until 1860, occupied by the papal legates, rises like a huge rock, is strengthened with corner-towers, and surrounded by a ditch. Its ecclesiastical edifices, which are very numerous, and of which the churches of Santa Maria degl' Angeli and of San Benedetto are the most remarkable in point of architecture, are rich in paintings by the great masters of the Ferrara and Bologna schools. Besides their valuable paintings, these churches contain numerous sculptured monuments of famous persons; the church of San Francesco has a curious echo, with sixteen reverberations. The university, founded in 1264, was reorganized in 1402, closed in 1794, and reopened in 1824. It is in high repute as a school of medicine and jurisprudence, and is attended by from 100 to 200 students. It has an excellent library, which, besides a variety of MSS., missal paintings, and old editions of printed works, contains several of the works of Tasso and Ariosto in their own hand. F. is specially remarkable for its art associations. Under the patronage of the dukes of Este, it produced a school of painters who rank high in the history of art; while in literature the name of F. is immortalized through its connection with those of Tasso, Ariosto, and Guarini. At the period of its greatest prosperity, F. had about 100,000 inhabitants, but in 1872 it had a population of only 33,332.

In 1849, the Austrians took possession of the town, but were compelled to abandon it at the commencement of the Italian campaign in June, 1859. In April, 1860, F., with the state of which it is capital, was formerly annexed to the kingdom of Italy under Victor Emanuel.

FERRA'RA, COUNCIL OF. The council of Basle, convened in 1431 to promote the reform of the church, having entered heartily into the work, was opposed by pope Eugenius IV., who, in 1437, issued a bull transferring the sessions to Ferrara. He was obeyed by only cardinal Julian, the president, and four bishops; the council itself con-

treatises on this subject alone have been written and elaborately illustrated. Amongst others, we may mention *British Ferns* (1s.), published by Routledge, London, as an excellent handbook, while the magnificent nature-printed work, published 2 vols., royal 8vo, by Henry Bradbury, supplies all needful information. Wardian cases, filled with them, have also become common, and are most pleasing ornaments of apartments. The principal species will be noticed under their particular heads.

FERNS (*ante*), a group of cryptogamous or flowerless plants, much prized for their beauty, of which more than 2,500 species have been described by botanists. They formed a prominent feature in the vegetation of the early geological ages, and are found at present in every quarter of the globe, being comparatively few and small in cold climates and large and abundant in the tropics. They grow from a woody stem that first creeps along or under the ground, then becomes erect, and sends forth from the sides, or at the top, leaves or fronds of varied and most curious patterns. They vary in size in different climates, from herbaceous perennial plants with a slight stem producing leaves often less than half an inch in length, to trees rising in the tropics to a height of from 50 to 60 ft., and sending out at the top a beautiful crown of fronds from 8 to 20 ft. in length. Ferns are fructified from the lower face or the edges of the fronds, on which are collections of capsules filled with seeds or spores. A spore on germination produces a structure which, compared with its immediate parent, is very small, and bears no resemblance to it in form or texture. It is called the prothallium, and its function is entirely reproductive; it develops sexual organs of two kinds, archegonia and antheridia, either on the same or different prothalia. Hence, in contradistinction to the sporophore—the function of which in this group of plants is purely vegetative—the prothalial generation is termed the oophore. The whole group of ferns (pteridophyta) has been classed as follows:

PTERIDOPHYTA.—Cormophyta with two distinct stages in the life-cycle. Sporophore with high vegetative differentiation. Oophore inconspicuous and destitute of vascular tissue.

Class I. *Filicinæ.*—Leaves highly developed. Sporangia numerous on the fertile leaves.

Sub-class 1. *Filices.*—Leaves without stipular appendages. Sporangia epidermal, containing spores of one kind developed in each from a single primary mother-cell.

Sub-class 2. *Stipulatæ.*—Leaves with stipula-like appendages. Sporangia containing spores of one kind developed in each from many endogenous primary mother-cells.

Class II. *Equisetineæ.*—Leaves rudimentary. Sporangia 5 to 10 on the fertile leaves.

Class III. *Lycopodinæ.*—Leaves small (except isoetes), simple. Sporangia solitary.

Sub-class 1. *Lycopodiaceæ.*—Spores of one kind.

Sub-class 2. *Ligulatæ.*—Spores of two kinds.

FER OLIGISTE is a mineralogical term applied to a variety of anhydrous red oxide of iron (Fe_2O_3), otherwise called *specular iron ore*. The famous Swedish, Russian, and Elba iron are in greater part prepared from this iron ore. The natural position of F. O. is in the primary rocks. See IRON.

FEROZABAD, a t. of India, in the British district of Agra, n.w. provinces, 24 m. e. from Agra. It is the principal place of a pergunnah of the same name. It was formerly named Chandwar, and was a place of much greater importance than at present. Its fine edifices are mostly deserted and in ruins; most of the inhabited houses being cottages thatched with straw. It is surrounded by a wall, outside of which are many mounds and shapeless ruins. Pop. '72, 14,255.

FERO'ZĒ PORE (so called from its founder, Feroze Toghluk, who reigned in Delhi from 1351 to 1388), in the Punjab, stands about 3 m. from the left or s.e. bank of the Sutlej, in lat. 30° 55′ n., and long. 74° 35′ east. At one time, a large and important town, as its massive fortifications and extensive ruins still indicate, it had sunk into poverty and insignificance before it actually came, in 1835, into the possession of the English. Since then, the place has regained much of its former consequence, holding out, with its wide streets and its colonnaded bazaars, the promise of a grand emporium of commerce. Politically, too, F. P. has become prominent under British supremacy, having been a starting-point, whether for war or for negotiation, in many of our dealings with Afghanistan and the Punjab. In connection with this feature in its history, the city contains a monumental church in honor of the memory of those, both privates and officers, who fell in the various conflicts with the Sikhs. The pop. in '68 was 20,592.—The *district* of the same name has an estimated area of 2,696 sq.m., and a pop. '68 of 549,253. It is now in part either barren or covered with jungle, but the ruins of towns and villages indicate that it must have been at one time both more fertile and more populous.

FERO'ZĒ SHAH, a village apparently within the district of Feroze Pore, and situated about 10 m. e.s.e. of the town of that name, is in lat. 30° 52′ n., and long. 74° 50′ e., lying about 12 m. from the left bank of the Sutlej. It claims notice mainly as the scene of the second in order of the four great battles of the first Sikh war. The conflict in question, which lasted two days, took place in Dec., 1845, ending in the rout of the

natives and the capture of their intrenchments. The British army was commanded by sir Hugh Gough and sir Henry Hardinge; and, as in the victory of Mudki, gained only three days before, it sustained heavy loss.

FEROZE SHAH CANAL, a work, including its branches, of 240 m. in length, demands detailed notice as well for its historical interest as for its economical value. It dates back as far as 1356, owing its origin, as well as its name, to Feroze Toghluk, king of Delhi. Viewed as a whole, it leaves the right bank of the Jumna in lat. 30° 19′ n.; and, after sweeping round so as to skirt Sirhind, a territory on the Sutlej, it rejoins its parent stream at Delhi in lat. 28° 39′, thus measuring, in mere difference of latitude, 100 geographical miles. This artifical water-course, intended principally for the purposes of irrigation, seems to be equally creditable to native enterprise and native skill. But, as nothing of the kind appears to be permanent in the east, this noble channel was so much neglected, that, in the beginning of the 17th c., it was cleared out by Vizier Ali Murdan Khan, who, in point of fact, was the first to carry it, through its lower half, back into the Jumna. Finally, the entire line has, during this 19th c., been again repaired and improved by the British government. In the light of repeated drought and famine, the importance of such undertakings as the Feroze Shah canal can scarcely be overrated.

FERRANDI'NA, a t. in the s. of Italy, in the province of Basilicata, stands on a height on the right bank of the Basento, 35 m. e.s.e. of Potenza. Good wine is produced in the neighborhood. Pop. about 6,000.

FERRA'RA, the most northern of the Italian provinces that are washed by the Adriatic. It extends immediately s. of the Po, between the main branch of which, and the Po di Primaro, it is for the most part inclosed. As one of the old delegations, it had an area of 1180 sq.m., with a population amounting to 244,524; but according to the *Statistica Administrativa del Regno d'Italia,* published in 1861, the province had undergone certain modifications, and its pop. was then only 194,161; in 1871, it was 215,369. The area consists, for the most part, of swamp and lake; and many rivers and canals intersect it. Between the Po di Volano and the Po di Primaro, the marshes become very extensive, and receive the name of *Valli di Comaccio.* This province produces great quantities of fish, affords good pastures, and carries on a great trade in corn and hemp. It was at one time a dukedom under the house of Este, but on the failure of a legitimate male heir, pope Clement VIII. wrested it from this family, and annexed it to the states of the church in 1598. It became part of the kingdom of Italy in 1860.

FERRA'RA, an ancient city of Italy, capital of the province of the same name, is situated in a low marshy plain in the delta of the Po, and about 4 m. s. of the main branch of that river, 28 m. n.n.e. of Bologna, and 40 m. n.w. of Ravenna. F. was first made a walled city by the exarch of Ravenna about the close of the 6th c., and in the following century (661 A.D.) became the seat of a bishop. In the middle ages, it was the great commercial emporium of Italy, and the seat of a court renowned throughout Europe; but now the city has a peculiarly deserted and melancholy appearance; grass grows on the pavements of its broad and regular streets, and its churches and palaces are either rapidly falling, or have already fallen into decay. It is surrounded with walls, and is strengthened by bastions and a fortress. The old castle, or ducal palace, once the residence of the dukes of Este, but recently, until 1860, occupied by the papal legates, rises like a huge rock, is strengthened with corner-towers, and surrounded by a ditch. Its ecclesiastical edifices, which are very numerous, and of which the churches of Santa Maria degl' Angeli and of San Benedetto are the most remarkable in point of architecture, are rich in paintings by the great masters of the Ferrara and Bologna schools. Besides their valuable paintings, these churches contain numerous sculptured monuments of famous persons; the church of San Francesco has a curious echo, with sixteen reverberations. The university, founded in 1264, was reorganized in 1402, closed in 1794, and reopened in 1824. It is in high repute as a school of medicine and jurisprudence, and is attended by from 100 to 200 students. It has an excellent library, which, besides a variety of MSS., missal paintings, and old editions of printed works, contains several of the works of Tasso and Ariosto in their own hand. F. is specially remarkable for its art associations. Under the patronage of the dukes of Este, it produced a school of painters who rank high in the history of art; while in literature the name of F. is immortalized through its connection with those of Tasso, Ariosto, and Guarini. At the period of its greatest prosperity, F. had about 100,000 inhabitants, but in 1872 it had a population of only 33,327.

In 1849, the Austrians took possession of the town, but were compelled to abandon it at the commencement of the Italian campaign in June, 1859. In April, 1860, F., with the state of which it is capital, was formerly annexed to the kingdom of Italy under Victor Emanuel.

FERRA'RA, COUNCIL OF. The council of Basle, convened in 1431 to promote the reform of the church, having entered heartily into the work, was opposed by pope Eugenius IV., who, in 1437, issued a bull transferring the sessions to Ferrara. He was obeyed by only cardinal Julian, the president, and four bishops; the council itself con-

tinued in session at Basle, declaring the act of the pope in attempting to transfer it illegal, and pronouncing against him sentence of suspension. To the five delegates, however, who met at Ferrara, others fresh from their homes were added, so that at the second session 72 bishops were present, over whom the pope presided. These were soon joined by the emperor from Constantinople, John Palæologus, who brought with him patriarchs, bishops, and other ecclesiastics, amounting in all to 700 persons. His object in coming was to effect the reunion of the Greek and Latin churches, in the hope that he could thus secure the aid of the west against the Turks, who were then pressing hard upon the empire, and were destined (as afterwards shown) soon to overwhelm it. The points of difference between the churches formed the chief subjects of discussion until the opening of the year 1439, when, on the plea that the plague was prevalent at Ferrara, the sessions were transferred to Florence. (See FLORENCE, COUNCIL OF.)

FERRA'RI, GAUDENZIO, sprung from a family which followed a career of art as if by inheritance, was born at Valdugia, in the Milanese, in 1484. A scholar of Andrea Scotto and Perugino, and the chosen associate and friend of Raphael, his own creations may be said to have caught some inspiration from each of these three great masters, while they also unmistakably reflect genius of a bold, unshackled originality. The chief characteristics of F.'s style are correct and vigorous delineation, extreme vividness and delicacy of coloring, noble grace of form and attitude, and unsurpassable art in the classic disposal of drapery. Being one of the most laborious artists of his day, he has executed innumerable paintings both in *fresco* and in oil, the greater part of which are possessed by the Lombard galleries. His most comprehensive work, the frescos at Barallo, in Piedmont, represents the Passion; the "Martyrdom of St. Catherine," to which he owes his brightest fame, is in the Milanese collection of paintings. He died in 1549, having formed some good scholars, the chief of whom is Andrea Solario.

FER'RATES are combinations of ferric acid (FeO_3), a weak unstable compound of iron and oxygen with bases. See IRON.

FERREI'RA, ANTONIO, one of the classic poets of Portugal, was born at Lisbon, 1528. He was educated at Coimbra, where he occupied himself with the study of the Italian and Latin authors, more especially Horace, whom he almost rivaled in conciseness, but not in elegance of expression. After holding for some time the office of a professor at Coimbra, he obtained a civil appointment of some importance at the court of Lisbon. He carried to perfection the elegiac and epistolary styles, already attempted with success by Sá de Miranda, and transplanted into Portuguese literature the epithalamium, the epigram, ode, and tragedy. His *Ines de Castro* is the second regular tragedy that appeared after the revival of letters in Europe, the first being the *Sophonisba* of Trissino. It is still regarded by the Portuguese as one of the finest monuments of their literature, for its sublime pathos and the perfection of its style. The works of F. are not numerous, as his official duties left him little leisure. He died 1569. All his works are distinguished by soundness and depth of thought. His expression is strong rather than sweet, is extremely animated, and full of that fire which elevates the mind and warms the heart. His efforts after brevity, however, frequently led him to sacrifice harmony to thought. His *Poemas Lusitanos* were first published at Lisbon, 1598, and the *Todas as obras de Ferreira* in 1771. Compare Sismondi's work, *La Littérature du Midi* (Paris, 1813), and Bouterwek's *Geschichte der neuern Poesie und Beredsamkeit* (12 vols. Gött. 1801–19).

FERRET, *Mustela furo*, an animal of the weasel family (*mustelidæ*), so nearly allied to the polecat (q.v.) that may regard it as a mere domesticated variety. It is of rather smaller size, the head and body being about 14 in. long, the tail 5½ in., the muzzle rather longer and more pointed, the head rather narrower; and the color is very different, being yellowish, with more or less of white in some parts, there being two kinds of hair, the longer partly white, the shorter yellow. The eyes are pink. It is, however, much more susceptible of cold than the polecat, and requires careful protection from it in climates where the polecat is a hardy native. It was imported into Europe from Africa, and was well known to the Romans, being anciently employed, as it still is, in catching rabbits, for which purpose it is often sent into their burrows muzzled, or "coped," by means of a piece of string, to drive them out into nets, or, with a string attached to it, it is allowed to seize a rabbit in the burrows, and is then drawn out, holding it fast. The usual plan, however, is to let the F. have free range of rabbit-holes unmuzzled, the rabbits being shot as they bolt. Attention to warmth and cleanliness is essential to the health of ferrets. They are capable only of partial domestication, acquiring a kind of familiarity with man, and submitting with perfect quietness to his handling, but apparently never forming any very decided attachment; and they never cease to be dangerous if not carefully watched, especially where infants are within their reach. If allowed any measure of freedom, they are ready to attack poultry, and kill far more than they can devour, merely sucking the blood. They generally breed twice a year, each brood consisting of six or nine. The female sometimes devours the young ones, in which case another brood is speedily produced.

FERRIC OXIDE, the PEROXIDE, or SESQUIOXIDE OF IRON, Fe_2O_3. The anhydrous peroxide, as found in nature, crystallizes in flattened, rhomboidal tablets, nearly black

and very brilliant, known to mineralogists as "specular iron;" it also occurs in compact red masses, called "red hematite." Prepared artificially, by calcining ferric protosulphate, or copperas, it is a red powder, called colcothar, used as a paint, and for polishing silver and mirrors. Magnetic iron ore is commonly held to be a compound of ferric oxide and ferrous oxide, $Fe_2O_3 + FeO = Fe_3O_4$.

FERRIDCYAN'OGEN is a compound organic radical which has not been isolated, but which forms with potassium a well-known compound used in the arts, called the ferridcyanide of potassium or red prussiate of potash. In the preparation of this salt, a solution of ferrocyanide of potassium is acted on by a stream of chlorine gas until the color of the liquid passes from yellow to deep red, and thereafter, on evaporation and cooling, fine red crystals are obtained. The chlorine (Cl) acts upon two equivalents of the ferrocyanide of potassium (twice $2K,FeC_6N_3 = 4K,Fe_2C_{12}N_6$), removing one equivalent of potassium (K), forming chloride of potassium (KCl), whilst the remaining constituents combine together, and produce one equivalent of ferridcyanide of potassium ($3K,Fe_2C_{12}N_6$, or $3K,Fe_2Cy_6$, or 3K,Fdcy). The latter is known commercially in red crystals, readily soluble in water, and yields a fine deep *Prussian blue* (Turnbull's blue) when mingled with solution of protosulphate of iron (green vitriol), and hence is used largely in dyeing and calico-printing.

FERRIER, JAMES F., LL.D., a metaphysician, was b. in Edinburgh, Nov., 1808. After studying at Oxford, where he took the degree of B.A. in 1832, he was admitted to the Scottish bar in 1833. In 1842, he was elected to the chair of history in the university of Edinburgh, and in 1845, to that of moral philosophy in the university of St. Andrews. Mr. F. early attracted notice by some metaphysical essays, which appeared in *Blackwood's Magazine;* and in 1854 he published the *Institutes of Metaphysics,* in which he endeavors to construct a system of idealism in a series of propositions, demonstrated after the manner of Euclid. He afterwards edited the collected works of his father-in-law, the late prof. John Wilson, of the university of Edinburgh. F. died at St. Andrews, June 11, 1864.

FERRIER, SUSAN EDMONSTON, aunt of the above, a successful novelist, was b. in Edinburgh in 1782, and d. in 1854. Her father, James Ferrier, one of the principal clerks of the court of session, and the colleague in that office of sir Walter Scott, lived on terms of intimacy with the wits and literati of his day in Edinburgh, and Miss F.'s talents and quick powers of observation were early called into play in the midst of the literary society in which her youth was passed. Her first work, *Marriage,* appeared in 1818, and this was followed by *The Inheritance* (1824) and *Destiny* (1831). The merit of these tales, which are characterized by genial wit, a quick sense of the ludicrous, and considerable ability in the delineation of national peculiarities, is sufficiently proved by the fact, that they have stood their ground, notwithstanding the enormous number of works of fiction which have flowed from the press since their publication. Miss F. enjoyed the esteem and friendship of sir Walter Scott, who, in the days of his strength, repeatedly gave expression to his appreciation of her talents, and who derived consolation from her sympathy in the season of gloom which darkened the close of his life.

FERRO, or HIERRO, the most western of the Canary isles, was formerly considered the most westerly point of the old world, and for this reason geographers at one time took it as the point of departure in reckoning longitudes, as is still done by the Germans and others. Hence, in all probability, originated the present hemispherical division of the maps of the world, F. being taken as the boundary-line. The English, however, have adopted the meridian of Greenwich as the first meridian, and in this their example is followed by the Dutch, and in sea-charts generally; area, 82 sq.m.; pop. 4,400. The meridian of F. is 18° 9′ w. of that of Greenwich. See LONGITUDE.

FERROCYAN'OGEN is a compound organic radical, generally regarded by chemists as existing in ferrocyanide of potassium, or the yellow prussiate of potash, but which has not yet been obtained in a separate state. The principal compound of F. is the ferrocyanide of potassium, which is prepared by heating to redness in a covered iron pot a mixture of 3 parts by weight of nitrogenized matter, such as dried blood, hoofs, parings of hides, scrapings of horn, or the flesh of old or diseased horses and other animals, 3 parts of carbonate of potash, and 1 part of iron filings. The carbon, nitrogen, and iron combine together, and form F. ($FeC_6N_3 = FeCy_3$, or Cfy), which, at the same time, unites with the potassium, and produces ferrocyanide of potassium, or yellow prussiate of potash (2K,Cfy). The compound which is obtained from the heated iron vessel is impure, but by repeated solutions in hot water, and recrystallization on cooling, the salt is obtained pure in fine large tabular crystals of a lemon-yellow color. The ferrocyanide of potassium is largely used in dyeing and calico-printing (q.v.), in the production of many shades of *Prussian blue;* and when it is treated with sulphuric acid, and subjected to heat applied, hydrocyanic or prussic acid ($HC_2N = HCy$) distills off from the mixture. The ferrocyanide of potassium is characterized by giving no indication of the presence of iron in its radical on the application of any of the tests for iron. It gives a light-blue precipitate on the addition of a solution of pro-

tosulphate of iron; a dark-blue precipitate with perchloride of iron; a ruddy brown precipitate with sulphate of copper; and a white precipitate with acetate of lead.

FERROL, a strongly fortified seaport of Spain, in Galicia, is most advantageously situated on a narrow arm of the sea, 14 m. n.e. of the town of Corunna. It was originally a fishing-town, until selected for its natural advantages as a seaport by Charles III., who erected here what was at one time the finest naval arsenal in the world, and destined it exclusively for the Spanish royal navy. The entrance to the harbor, formed by a narrow inlet from the bay of Betanzos, admits of the approach of only one ship-of-the-line at a time, and is defended by the castles of San Felipe and Palma. The town is defended by walls and fortifications, is, on the whole, regularly built, and has several squares and pleasing alamedas or public walks. The arsenal, in which fifteen ships-of-the-line could be simultaneously built, covers a great space; and though now in a somewhat ruinous condition, is still the most important in Spain. F. has manufactures of hats, naval stores, hardwares; and exports corn, brandy, vinegar, and fish. Pop. (including the garrison) 16,640.

FERROTYPE, a term applied by Mr. Robert Hunt, the discoverer, to designate some photographic processes, in which salts of iron play an important part. Like many of the earlier paper processes, the F. is far inferior in sensibility to the more modern collodion process or Archerotype, and is on that account seldom if ever used even for landscapes.

FERRUGINOUS is a term employed in chemistry to denote the presence of iron in natural waters, minerals, etc. It is synonymous with the term chalybeate. See CHALYBEATE WATERS.

FERRY (from Sax. *faran*, Ger. *Fahren*, to move, proceed, allied to the Lat. *fero*, Eng. *bear*), a passage by boat across water. By the law of England, a man may have a right to keep a boat and to ferry passengers for a consideration, just as he may have a right to hold a fair, either by royal grant, or by prescription, from which a royal grant at some previous time will be presumed. No other title, unless conferred by act of parliament, will suffice, for no fair, market, or F. can be set up without license from the crown either actual or presumed. The possessor of such a title need not necessarily be the proprietor of the soil on which the market is held, or of the water over which the right of F. is exercised. In the latter case, he need not be the proprietor of the soil on either side of the river, though he must possess such rights over it as will enable him to embark and disembark his passengers. As fulfilling his part of the bargain with the public, the owner of a F. is bound to keep a boat fit for the purpose of carrying passengers, whilst on the other hand he has a right of action not only against those who refuse or evade payment of the toll or passage money, but against those who disturb his franchise by setting up a new F. so near as to diminish his custom.—Stephen, i. pp. 663, 664. It has been more than once decided, that, the erection of a second F. in such circumstances is a nuisance to the owner of the old one, who is bound to keep his F. in readiness for the use of the queen's subjects, a burden which is not shared by his rival (North and South Shields Ferry Co. *v.* Barker, 2 Exch. 136). The rule in Scotland as to rival ferries is the same; but a grant of F. from the crown to one heritor does not prevent his neighbors from keeping private boats for the transport of themselves and their families and servants. Where ferries have not been given out by royal gift, either express or presumed as above described, they are *inter regalia*, i.e., they belong to the crown for the public benefit. In this case, they are under the management of the trustees of the roads connected with them, or are regulated by the justices of the peace for the county, or by special acts of parliament. By 8 and 9 Vict. c. 41, certain rules are laid down for the regulation of ferries. The act is confined to Scotland.

Common rowing-boats are generally used for ferrying foot-passengers, but when horses and carriages have to be taken across, a flat-bottomed barge, with an inclined plane at one end, to rest upon the shore, for landing and embarking, is generally used. This is either rowed across or pulled by a rope. When the current is strong, and the river of moderate width, the latter is best. The rope stretched across the river passes through rings or over pulleys attached to the barge, and the ferrymen move the barge across by pulling the rope. The chief advantage of the rope is to restrain the barge from drifting in the direction of the stream. With a small boat, this is obviated by the ferryman rowing obliquely, as though he were steering for a point higher up the river; thus he moves through the water upwards to the same extent that the water moves over the land downwards; and by a composition of these motions, and his tending to the other side, is carried directly across. Broad estuaries are now traversed in many places by steam-ferry.

Rafts are sometimes used for ferrying. On the Nile, a sort of raft is made of inverted earthen-pots full of air. For further information on the crossing of rivers, see FORD, FORDING.

Flying-bridge is the name given to a kind of ferry-boat which is moved across a river by the action of the combined forces of the stream and the resistance of a long rope or chain made fast to a fixed buoy in the middle of the river. The boat thus attached is made to take an oblique position by means of the rudder; the stream then acting against

the side, tends to move it in a direction at right angles to its length, while the rope exerts a force in the direction towards the buoy. If these two forces be represented by the sides of a parallelogram, the actual course of the boat would be in the direction of the diagonal (see COMPOSITION AND RESOLUTION OF FORCES); but as the length of the rope remains the same, the boat must continue always at the same distance from the buoy, and therefore its course is a curve, a portion of a circle, of which the buoy is the center, and the rope the radius. The course of the boat and the action of the two forces are strictly analogous to the path of a rising kite, and to the forces of which this path is the resultant. The holder of the kite corresponds to the buoy, the wind to the tidal stream, and the tail to the rudder. Flying-bridges are used for military purposes, and the modes of adapting them to the varying circumstances of the width of rivers and the velocity of their currents, forms a part of the study of military engineering. An important element in the problem, is the determination of the right point of attachment for the rope. In the case of a wide river, the rope or chain requires to be of considerable length, and must be supported by movable buoys or by small boats.

FERRY (*ante*), in the United States, usually an important and valuable property, owned or assumed by the local governments, and regulated by laws. The city of New York holds the right to control ferries from the English colonial charter, and no ferry can be started to or from the island on which the city stands without consent of the corporation. But usually one state has the right to establish a ferry over a navigable river separating it from another state, although its jurisdiction may not extend beyond the middle of the stream. In the case of New York city, the corporate rights extend to low-water mark on the opposite shores, and therefore the city practically controls all ferries. Ferry franchises are commonly protected by their express terms from infringement or rivalry. The franchise of a ferry is an incorporate hereditament, is subject to dower, may descend to heirs, may be leased, sold, and assigned; but inasmuch as the people have an interest in it, it is subject to legislative regulations for the protection and enforcement of public rights. Controllers of ferries and carriers are subject to all laws affecting such public servants, with respect not only to care of property, but also to safety of life. Tenants or lessees of ferries are owners in law in case of injury.

FERSEN, AXEL, Count, 1755–1810; marshal of Sweden, son of count Axel, a state senator; educated by his father, and in the Turin military academy. He was aide to Rochambeau in the American revolution, and was present at the surrender of Yorktown. Returning to France at the time of the French revolution, he became a warm friend of the royal family. When they fled from Paris he disguised himself and acted as their coachman, conducting them as far as Bondi, whence they were sent on under other care. After the failure of the scheme and the imprisonment of the royal family, he exerted himself in every way for their comfort. After their execution he returned to Sweden, and became chancellor of Upsala university. Not long after, he was plenipotentiary to the Rastadt congress. When the crown-prince of Sweden suddenly died in June, 1810, Fersen and his sister were suspected of procuring his death by poison. At the funeral they were attacked by the mob, and he was slain, the sister escaping. Their complete innocence was afterwards satisfactorily proved.

FERTILIZATION OF PLANTS. See FECUNDATION.

FERTILIZERS. See GUANO, MANURES, PHOSPHATES, *ante*.

FESA, or FASA, a t. of Persia, in the province of Fars, 80 m. s.e. of Shiraz, is situated in a mountain defile, is of considerable size, and is said to have a pop. of 18,000. It has manufactures of silken, woolen, and cotton fabrics, and some trade in a superior kind of tobacco which is grown in the vicinity.

FESCENNINE VERSES, a branch of the indigenous poetry of ancient Italy, were a sort of dialogues in rude extempore verses, generally in Saturnine measure, in which the parties rallied and ridiculed one another. It formed a favorite amusement of the country-people on festive occasions, especially at the conclusion of harvest and at weddings. As was to be expected, it often degenerated into licentiousness, that at last required the curb of the law. The F. V. are usually considered to be of Etruscan origin, and to have derived their name from the Etrurian town Fescennium; but there is little probability in this etymology. Verses of this sort were and are popular to this day all over Italy. The name is more likely connected with *fascinum*, fascination, enchantment, or the evil eye, against which the chanting of verses may have originally been intended as a protection.

FESCH, JOSEPH, Cardinal and archbishop of Lyons, was b. 3d Jan., 1763, at Ajaccio. His father, a Swiss officer in the service of Genoa, had married a widow, whose daughter by a former husband, Letizia or Lætitia Ramolino, became the mother of Napoleon Bonaparte. F. was thus the half-brother of Letizia, and the uncle of the future emperor. He had entered the clerical profession, but left it at the outbreak of the French revolution, and, in 1795, became commissary to the army of the Alps under his nephew in Italy. The first consul having resolved on the restoration of the Catholic worship, F. resumed the clerical habit, and was active in bringing about the concordat with pope Pius VII. in 1801. He was now (1802) raised to be archbishop of Lyons, and in the following year to be cardinal. In 1804, he was sent as French ambassador to Rome,

where he ingratiated himself with the pope by his adroit management and ultramontane sentiments, and contributed to induce the pope to undertake his mission to Paris to consecrate Napoleon as emperor. F. accompanied the pope, and assisted at the coronation; and for his services at Rome, he was rewarded by the office of grand almoner and a seat in the senate. In 1806, the archbishop of Regensburg, arch-chancellor and first prince elector of the just expiring German empire, and about to become the prince primate of the nascent confederation of the Rhine, chose F. to be his coadjutor and successor; and, along with all these dignities, he received a stipend of 150,000 florins a year. In 1809, Napoleon wished to invest him with the archbishopric of Paris, but F. declined it, as he had long been dissatisfied with the emperor's policy in regard to the papal chair. In 1810, he presided at a national conference of clergy assembled at Paris, and the views which he maintained there, with even more than usual keenness, brought him into disgrace with the emperor, who was still further exasperated against him on account of a letter which F. wrote to the pope, then (1812) in captivity at Fontainebleau, and which was intercepted. He lost his imperial dignities and pension, and the prospects of the primacy of the Rhine confederation were also taken away by the appointment of prince Eugene to be grand duke of Frankfort. After this, F. lived in a sort of banishment at his bishopric of Lyons. At the approach of the Austrians in 1814, he fled to Rome with his stster Letizia, the mother of the emperor, where he was received with open arms by the pope. The return of Napoleon brought him back of France, and during the hundred days, he was nominated a member of the chamber of peers, though he never took his seat; but, after the battle of Waterloo, he had again to take refuge in Italy. The royalist clergy now persecuted him with accusations and lampoons which he in no way deserved. His resistance to the will of his nephew, and indeed his whole conduct, seem to have been actuated by sincere zeal for what he considered to be the interests of the church. When called upon by the Bourbons to resign his episcopal office, he obstinately refused; and it was not till 1825, after receiving a papal brief interdicting the exercise of his clerical functions, that he resigned the charge, but not the title. In 1837, an attempt was made to reinstate him, to which, however, the French government refused assent. He lived in the greatest friendship with his sister, Madame Mère, as she was styled, till his death. He died 13th May, 1839. Of his famous and very large collection of paintings, he bequeathed a part to the city of Lyons, and the rest was disposed of in a series of auctions at Rome after his death.

FESCUE, *Festuca*, a genus of grasses, very nearly allied to brome-grass (q.v.), and having in some species a loose, in some a contracted panicle; the spikelets many-flowered, with two unequal glumes, which they much exceed in length; each floret having two lanceolate paleæ, the outer palea rounded at the back, and acuminate or awned at the summit; the stigmas growing from the apex of the germen. The species are numerous, and are very widely diffused over the world, both in the northern and southern hemispheres. Among them are many of the most valuable pasture and fodder grasses. None are more valuable than some of the British species.—MEADOW F. (*F. pratensis*), a species with spreading panicle and linear spikelets, from 2 to 3 ft. high, common in most meadows and pastures of rich soil, in Britain and throughout Europe, in northern Asia, and in some parts of North America, is perhaps excelled by no meadow or pasture grass whatever. It is suitable both for alternate husbandry and for permanent pasture.—SPIKED F. (*F. loliacea*)—by many botanists regarded as a variety of meadow F., although it departs from the habit of the genus in having the branches of the panicle reduced to a single spikelet, and forming a two-rowed raceme or spike—is regarded as an excellent grass for rich moist meadows.—HARD F. (*F. duriuscula*), a grass from one foot and a half to 2 ft. high, with a somewhat contracted panicle, mostly on one side, is one of the best grasses for lawns and sheep-pastures, particularly on dry or sandy soils. Several varieties are known to seedsmen and farmers.—CREEPING F. or RED F. (*F. rubra*) is probably a mere variety of hard F., being distinguished chiefly by its extensively creeping root, which particularly adapt it to sandy pastures, and to places liable to occasional inundations.—SHEEP'S F. (*F. ovina*) is a smaller grass than any of these, not generally exceeding a foot in height, and often much less, abundant in mountainous pastures, and especially suitable for such situations, in which it often forms a principal part of the food of sheep for many months of the year. It is common in all the mountainous parts of Europe, and in the Himalaya; it is also a native of North America, and species very similar, if not mere varieties, abound in the southern hemisphere. Its habit of growth is much tufted.—TALL F. (*F. elatior*) is a grass of very different appearance, 4 or 5 ft. high, with spreading much branched panicle, growing chiefly near rivers and in moist low grounds, and yielding a great quantity of coarse herbage, which, however, is relished by cattle.—Of foreign species, which have been introduced into Britain, *F. heterophylla* best deserves notice, a tall species with narrow root-leaves, and broad leaves on the culm; a native of France and other parts of the continent of Europe, and pretty extensively cultivated in some countries, particularly the Netherlands.—All these species are perennial.—Some small annual species occasionally form a considerable part of the pasture in dry sandy soils, but are never sown by the farmer.—A Peruvian species (*F. quadridentata*), called *pigouil* in its native country, and there used for thatch, is said to be poisonous to cattle.

FESS. The F. in heraldry consists of lines drawn horizontally across the shield, and containing the third part of it, between the honor point and the nombril. It is one of the honorable ordinaries, and is supposed to represent the waist-belt or girdle of honor, which was one of the insignia of knighthood.

PER FESS.—A shield, or charge in a shield, is said to be *party per fess*, when it is horizontally divided through the middle, or, as the French say, simply *coupé*.

FESSWISE is said of a charge placed *in* F.; that is to say, horizontally across the shield.

FESSENDEN, FRANCIS, b. Maine, 1839; graduated at Bowdoin, and studied law. In 1861, he was appointed capt. of infantry; was wounded at Shiloh, became col. of volunteers, and commanded a brigade at Chantilly, and at other places. He received a number of promotions, and in 1866 was appointed lieut.col. of the 28th U. S. infantry.

FESSENDEN, THOMAS GREEN, 1771–1837; b. N. H.; graduated at Dartmouth in 1796; studied law, and occupied his leisure hours in writing humorous and sarcastic verses for a newspaper edited by Joseph Dennie. In 1803, he published in London, anonymously, *Terrible Tractoration*, a satire upon the medical profession, and especially upon the then famous metallic tractors of Dr. Perkins. The work was enlarged, and reached a third edition. In 1822, he started the *New England Farmer*, with which he was connected until his death. Among his works are *Democracy Unveiled; American Clerks' Companion; The Ladies' Monitor; Laws of Patents for New Inventions.* For two years he edited the *Weekly Inspector* in New York city.

FESSENDEN, WILLIAM PITT, LL.D., 1806–69; b. N. H.; graduated at Bowdoin in 1823; admitted to the bar in 1827, and soon afterward made his home in Portland, Me. He was a member of the state legislature in 1832; of congress in 1841; and of the U. S. senate in 1853. Being rechosen in 1859, he was appointed chairman of the finance committee, and throughout the war of the rebellion rendered valuable service by aiding the secretary of the treasury to maintain the national credit, as well as by his counsel in the senate chamber. In 1864, on the retirement of Mr. Chase from the secretaryship of the treasury, he accepted that portfolio, and discharged the duties of the office during a most critical period of the nation's finances, until Mar., 1865, when, owing to failing health, he resigned, and resumed his seat in the senate, to which he had been re-elected. He began his career as an ardent whig; was a member of the whig national conventions of 1840 and 1848, in the latter advocating the nomination of Webster; but in the convention of 1852, he opposed Webster, and favored Scott. He was one of the founders of the republican party, in which he became a prominent leader.

FESSLER, IGNAZ. AURELIUS, a celebrated Hungarian historian, was b. in 1756, in the co. of Soprony or Oedenburg. During a long life full of adventures, F. served successively the emperor Joseph II., the king of Prussia, and the emperor of Russia; and also held the office of professor of oriental languages at different universities. He died at St. Petersburg, 15th Dec., 1839. Among his works of a lasting value are *Attila* (Breslau, 1794), *Mathias Corvinus* (2 vols. 1793; 2d edition, 1806, Breslau), and the History of the Hungarians, etc. (*Geschichte der Ungarn und deren Landsassen*, 10 vols. Leip. 1812–25). His autobiography, entitled Recollections of my 70 Years' Pilgrimage (*Rückblicke auf meine 70 jährige Pilgerschaft*, Breslau, 1826; 2d edit. Leip. 1851), is also a very interesting work. Deep learning, coupled with a rare beauty of style, render F.'s works (all written in German) attractive in the highest degree.

FESTIVAL PLAYS. See MORALITIES, MIRACLE PLAYS, MYSTERIES.

FESTIVALS, or FEASTS (Lat. *festum*, probably from the same root as *fast* (q.v.); according to some, from Gr. *hestia*, hearth), a term denoting certain periodically recurring days and seasons set aside by a community for rest from the ordinary labor of life, and more or less hallowed by religious solemnities. Originating within the narrow circle of the family, and commemorating momentous events affecting one member or all, these pauses became more frequent, and of wider scope, as the house gradually expanded into a tribe, a people, a state. The real or imaginary founders, legislators, heroes, became objects of veneration and deification, and the salient epochs of their lives the consecrated epochs of the year. National calamities or triumphs were, in the absence of annals, best remembered by corresponding general days of humiliation or exultation. Earliest of all, however, did the marked stages in the onward march of nature; spring and autumn, seed-time and harvest-time—symbols of life and death; the solstices—turning-points of summer and winter; the new moon and the full moon; the termination of cycles of moons and cycles of years, present themselves as opportune halting-places for man himself. No less were the all-important periodical rises of fertilizing rivers, and the anniversaries of importations and inventions of new implements for the better cultivation of the soil, or tending of the flocks, befittingly celebrated. The inherent human tendency towards referring all things of graver import, life and death, abundance and want, victory and defeat, to a higher power, could not but infuse a religious feeling into epochs so marked. Fostered and guided by priests and lawgivers, this property of our nature erelong found its expression in common sacrifices, prayers, and ceremonies, consecrated to the various superior and minor deities who presided over

and inhabited the elements of the visible and invisible creation, and who, working all the changes within them, acted, each in his sphere, as a partial providence over man. According to the event which called them forth, these F. were mournful or joyous, jubilant or expiatory. Even when sorrow was to be expressed, the mortification of the body did not always suffice, but plays, songs, dances, and processions full of boisterous mirth, were resorted to—as in the F. of Isis at Busiris, of Mars at Papremis, in the Adonia of Egypt, Phenicia, and Greece—because the divine wrath or sorrow was, like that of man, to be changed into satisfaction. Besides the relation between the common tutelary deity and those he protected, the bond also by which the otherwise disconnected members of the body-politic were held together was, by means of these festive gatherings, periodically brought in view, and invested with greater strength and importance. Apart, however, from this their historical, astronomical, religious, and political end, F. served another purpose—that of growing civilization. It was the glowing spirit of emulation which, stimulating the gifted in mind and body to strive for the festive laurel in contests of genius and skill, in honor of the gods, and in the face of all the people, matured all that was noble and brilliant within the community. Archaic rudeness and rustic extravagance became refined grace and classic harmony. The stirring drama, the glorious anthem, the melodious dance, the elegant game, which accompanied the festive sacrifice of some nations at their highest stage of development, had arisen out of those very mimicries and shouts, rude and savage beyond expression, of generations not long before them. Enthusiastic, wild, metaphysical Egypt invested the countless days consecrated to her deified stars, plants, animals, and ideas; to the Nile, to Ammon, Kneph, Menes, Osiris; to Horus, to Neitha, to Ptah, with a mystery, sensuality, and mournfulness always exaggerated, sometimes monstrous. The Hindu, no longer daring to offer human sacrifices, shows his odd and cruel materialism by throwing into the waves, on his festival of rivers, some of his costliest goods, gold, jewels, garments, and instruments; while in the licentiousness and debaucheries perpetrated on the festival of Shiva, the god of procreation, or on the Bacchantics of the goddess Bhavani, he exceeds even those of the Egyptians on their Neitha feasts at Bubastis, and the Greek worship of Venus in her Cyprian groves. Phenicians and Assyrians, Babylonians and Phrygians, according to the little we know of their religions and manners, appear to have feasted, thanked, propitated, mourned all at different times, and in the way most befitting their several natures, even in the case of those gods and F. which they had in common.

The ancient Persians alone of all nations had no F., as they had no temples and no common worship, These "Puritans of Polytheism," who worshiped the sun only, and his representative on earth, fire, scorned show and pomp, and large religious gatherings. A striking contrast to them is formed, in another hemisphere, by the ancient Mexicans, who were found to possess one of the most richly developed calendars of F., scientifically divided into movable and immovable feasts. As a strange and singular phenomenon among F., we may also mention here that "of the Dead or Souls," celebrated among the wild tribes of North America. At a certain time, all the graves are emptied, and the remains of the bodies buried since the last festival are taken out by the relatives, and thrown together into a large common mound, amid great rejoicings and solemnities, to which all the neighboring tribes are invited.

Greece had received the types of civilization, religion, and art from Egypt and the east generally, but she developed them all in a manner befitting her glorious clime and the joyous genius of her sons. At the time of the *Iliad*, two principal festivals only—the harvest and the vintage—seem to have been celebrated (ix. 250); but they increased with such rapidity, that in the days of Pericles they had reached the number of a thousand; some indeed being an epitome only of their memorable feats of arms, others restricted to one town, or province, or profession, or sex, or to a few initiated, or recurring only at intervals of several years; but there were still so many kept by the whole people that ancient writers bitterly denounce them as merry beginnings of a sad end, as the slow but sure ruin of the commonwealth. Their forebodings proved true enough; and yet Greece would certainly never have reached the highest place among nations, as far as literature, the arts, and philosophy are concerned, had it not been for the constant contests attached to her many festivals. She resisted Asia, because her citizens were always alert, always ready. The religious part of the festival—homage offered to personified ideas—consisted mostly in the carrying about of the deity of the day to the sound of flute, lyre, and hymns, and in a sacrifice, followed by a general meal upon certain portions of the animal offered. Then followed scenic representations symbolizing the deeds of the gods; after which came games and matches of all kinds—foot, horse, and chariot races, leaping, boxing, throwing, wrestling, etc. Separate accounts are given of some of the more remarkable Greek festivals. See BACCHUS, ELEUSINIAN MYSTERIES, PANATHENÆA, etc. There were also special times set aside for the "holy games" proper. The most important of these were the Olympian, the Pythian, the Nemean, and the Isthmian. (See these heads.) As all these festivities were provided out of the public purse—from the confiscated estates of the "tyrants" and political delinquents—the individual did not suffer more than a welcome interruption of his usual business, and under that genial sky the penalty to be paid for occasional indolence was not too heavy.

Rome, founded amid pastoral festivities in honor of some god Pales, adopted and acclimatized, as she went on from conquest to conquest, the foreign deities, exactly as, with her usual prudence and practical sense, she conferred her right of citizenship on her foreign inhabitants, and on whole nations subjected to her rule. Her yoke was thus less galling to the new provinces, while at the same time the populace at home found sufficient distraction in the many ancient and newly imported F., with their quaint rites and gorgeous pageantry. Yet the Romans—more parsimonious and abstract by nature than the vivacious Greek neighbors from whom they had accepted the greatest part of their religion—never exceeded in their F. the number of one hundred, and in these, again, a distinct line was drawn between civil and religious ones. Some of the principal religious F. were the Sementinæ, on the 25th of Jan.—the rural festival of the seed-time; the Lupercalia, in honor of Pan; the Cerealia; the night festival of the Bona Dea; Matronalia; Minervalia, etc. To the purely civil ones belong the Janualia, the 1st of Jan. and the new-year's day, when the new consuls entered upon their office, and friends used to send presents (*strenæ*) to each other; the Quirinalia, in memory of Romulus, deified under the name of Quirinus; and the Saturnalia, in remembrance of the golden age of Saturn, beginning on the 19th of Dec. The celebration of these F. was in all respects imitated from the Greeks, with this difference only, that the games connected with them became, with the pre-eminently bellicose Romans, terribly life-like images of war. Their sham sea-fights; their pitched battles between horse and foot, between wild beasts and men; their so-called Trojan games, executed by the flower of the nobility; their boxing-matches (with gloves that had lead and iron sewed into them): circus, arena, and amphitheater gave, especially in later times, the greater satisfaction the greater the number of victims.

It is one thing only that monotheism has in common with polytheism with respect to its F.—namely, that they are with each the religious expression of human joy or human sorrow. But if the former, with a dim misgiving of some awful and supreme power, invited the multifarious governors of the many provinces of nature to partake, as guests, of bodily and intellectual feasts, *together* with their hosts; monotheism, in binding up all fear and all hope, all gratitude and all awe, which moved the heart of man, in one almighty Creator, Mover, and Maintainer of all things, celebrated its F. in honor of this omnipresent Spirit with a veneration, a purity, and a lofty elevation, such as the worshipers of star, animal, or image never knew. With the first and strictest monotheists, the Hebrews, whose very existence as a nation was traced to the special and miraculous interference of this highest and only God, the remembrance of that great event, their liberation from Egypt, and the momentous period of preparation in the desert which followed it, mingled with almost all their religious observances, and especially their F., and infused into them all a tone of deep and fervent gratitude; while at the same time it held ever before their eyes the cause of their nationality, and their aim and destiny "to be a kingdom of priests and a holy people." The Hebrew F., too, are of a historical, agricultural, astronomical, and political nature; but they mostly combine all these characteristics, and are always hallowed by the same religious idea, and the same piety and devotion to one and the same holy name. Connected with their F. were no plays and no representations of a god's deeds, no games and no cruelty, no mystery and no sensuality, but the sacrifice of the day, and a special occupation with the divine law, were the visible signs of the exalted seasons. The influence of the number seven—an influence met with among most eastern nations—is seen in the recurrence of many of the Jewish solemnities. See SEVEN. The Sabbath, the first and most important of these septenary festivals, is treated of under its own head. Of the service in the temple, and of the way in which this and the other F. were and are kept after the destruction of the temple, something will be said under HEBREWS and JEWS. The most exalted of new-moon F. was that of the first day of the seventh month, "the day of remembrance of the sounding," or "of trumpets" (Lev. xxiii. 24), to which, in later times, when the Seleucidan era was introduced (the Syrian year beginning with the autumnal equinox), the name of Rosh hashana (New Year) was given; notwithstanding that in Exodus (xii. 2) Nisan is spoken of as the first month of the year. After a period of six years of labor, the earth, too, was to celebrate a Sabbath-year; what it produced spontaneously belonged to the poor, the stranger, and to animals. It is remarkable that even Alexander the great and Cæsar remitted the taxes of Judea in this year of *Shemitta* (abandoning). After a revolution of seven times seven years, the year of Jubilee, or Jobel, was to be celebrated, in which all the Hebrew slaves were set free, and all land which had been sold in the interval was restored to the former owners, in order that the original equilibrium in the families and tribes should be maintained intact. (These two F., however, were, according to the Talmud, not kept before the Babylonian captivity.) The preeminently agronomical and historical F. were the three *Chuggim* (whence the Arab. *Hagg*, a pilgrim to Mecca)—viz., Pesach (Passover), Schabuoth (Feast of Weeks), and Succoth (Feast of Tabernacles), on which three every male was obliged to go up to Jerusalem and offer some of the first fruits, besides the prescribed sacrifices (see PASSOVER, etc.).

The postmosaic and exclusively historical F., Purim, the feast of Haman, Chanuca, the feast of the Maccabees, will be noticed in the article on JEWS.

Only a cursory glance can be here taken of the Christian F., which are treated fully

and separately under their various names. They were for the most part grafted, in the course of time, upon the Jewish and pagan ones, but always with a distinct reference to Christ and other holy personages. The weekly day of rest was transferred from Saturday to Sunday, and called the Day of Joy, or Resurrection, just as the weekly Jewish fasts of Monday and Thursday were changed for Wednesday and Friday. See FASTS. For a long time, both Saturday and Sunday were celebrated, especially in the east. Two separate celebrations took the place of the Jewish Passover: the *Pascha Staurosimon* was the festival of the death, the *Pascha Anastasimon* of the resurrection of our Lord (see EASTER); and the festival of Pentecost, or the law-giving at Sinai, became the festival of the outpouring of the Holy Ghost, and of the inauguration of the New Covenant.

In the course of the 4th c., two new F. were introduced: Epiphany (q.v.), which originated in the east; and that of the Nativity or Christmas (q.v.). Circumcision, Corpus Domini, the F. of the Cross, of Transfiguration, of the Trinity, and many others, are of still later date. The veneration felt for Mary as the "mother of God," found its expression likewise in the consecration of many days to her special service and worship; such as that of her presentation, annunciation (Lady's Day), assumption, visitation, immaculate conception (q.v.), and many minor F., over and above the Saturdays, which, in some parts, were entirely dedicated to her, in order that the mother might have her weekly day like the Son. Besides these, there were F. of angels, of apostles, saints, martyrs (on the supposed anniversary of their death, called their birthday, *dies natalis*), of souls, ordinations, etc.

Celebrated at first with all the primitive simplicity of genuine piety, most of these F. were ere long invested with such pomp and splendor that they surpassed those of the ancient Greeks and Romans. Burlesque, even coarse and profane representations, processions, mysteries, and night-services, were, in some places, although unauthorized by the general church, connected with them, and voices within the church loudly denounced these "pagan practices." Ordinances forbidding mundane music and female singers for divine service were issued, the vigils were transformed into fasts, days of abstinence and penance were instituted, partly as counterpoises, but with little result. Nor did the prodigious increase of these festive occasions, and the rigor with which abstinence from labor was enforced in most cases, fail to produce the natural results of indolence and licentiousness among the large mass of the people. Bitter and frequent were the complaints throughout Christendom; but although even men like archbishop Simon of Canterbury (1332), Petrus de Alliaco, Nicolaus of Clemangis, did their utmost to obtain a reduction of these festive occasions, which overspread well-nigh the whole year, it was only after the most decided and threatening demands, such as that pronounced by the German diet of Nürnberg in 1522, that pope Urban was prevailed upon to reduce the number for Catholic Christianity (1642). Benedict XIV. (1742), Clement XIV. (1773), followed in the same direction. On the change produced both in their number and in the manner of their celebration through the reformation, we must forbear to enlarge here.

The Christian F. have been divided variously: into *feriæ statutæ* (returning annually at fixed times), *indictæ* (extraordinary, specially proclaimed), *duplicia* (double reminiscence, or of higher importance), *semiduplicia* (half double), etc. Another division is into weekly and yearly feasts, these latter being subdivided into greater and minor, or into movable and immovable. There is also a distinction made between *integri* (whole days), *intercisi* (half-days), etc.

The only trace of the ancient manner of dating a festival from the eve or vesper of the previous day—a practice discontinued since the 12th c., when the old Roman way of counting the day from midnight to midnight was reintroduced—survives in the "ringing in" of certain days of special solemnity on the night before, and in the fasts of the vigils.

On some of the principal Mohammedan F., partly based upon those of the Jews and Christians, such as the weekly Friday, the Yom Ashoora (the Jewish day of atonement), the birthday of the prophet (Molid An-Nebee), that of Hussein, of Mohammed's granddaughter Zeyneb, of the night of the prophet's ascension to heaven (Leylet Al-Mearag), the night of the middle of the month Shaabán, in which the fate of every man is confirmed for the ensuing year; the Eed Al-Shagheer or Ramadan-Beyram, at the end of the Ramadan fasts, and the Eed Al-Kabir, or the great festival of the sacrifice (Kurban Beyram), see MOHAMMEDANISM. For further information, see Herodotus (ii. 60); Plutarch (vii.); Strabo (vi. and x); Ovid, *Fasti;* Macrobius, *Sat.* i. 7, 11; Meursius, *Græcia Feriata;* Meiners, *Geschichte d. Relig.;* Fasold, *Ierologia;* Bible; Mishna; Gemara; Shulchan Aruch; Josephus; Philo; Maimonides; Buxtorf, *Lex. Talm.; Synag. Jud.;* Bartolocci, *Bibl. Rabb.;* Lightfoot, *Hor. Hebr. and Talm.;* Lund, *Bibl. Hebr.;* Wette, *Archæologie;* Neander, *Hist. of the Ch.;* Blackmore, *Christ. Antiq.;* Baumgarten, *Erläuterung d. chr. Alterth.;* Siegel, *Handb. d. chr. Alterth.;* Mai, *Discorsi di Argomento Religioso;* Koran, etc.

FESTOON, in architecture, a sculptured wreath of flowers or fruit, frequently used as an ornament in Roman and renaissance buildings. Like many of the other ornaments of classic architecture, it owes its origin to one of the sacrificial emblems, viz.,

the flowers with which the heads of the animals, the altars, etc., used to be decorated. The F. occurs along with bulls' heads on the frieze of the temple of Vesta at Tivoli.

FESTUS PORTIUS, successor of Felix as procurator of Judea; sent there by Nero about 60 A.D. It was he who heard the case of the apostle Paul, whom Felix had left prisoner, and but for the fact that Paul had already appealed to Rome he would have set the apostle free. He had some difficulties with the Jews, but none of great importance. Josephus gives him the character of a just and vigilant magistrate.

FESTUS, SEXTUS POMPEIUS, a Latin lexicographer of the 3d or 4th c. of our era, is one of the most important ancient authorities we have on the Latin language. He made an epitome of the great work of Verrius Flaccus, *De Verborum Significatione.* This compilation, which was arranged alphabetically in 20 books, was still further abridged and spoiled in the end of the 8th c. by Paul, son of Warnefried, commonly called Paulus Diaconus. The great work of Flaccus has unfortunately entirely perished, and of the abridgment made by F., only a single MS., and that in a deplorably imperfect condition, has survived. It came from Illyria, and fell into the hands of Pomponius Lætus, a distinguished scholar of the 15th century. It ultimately passed into the library of cardinal Farnese, at Parma, and is now preserved at Naples. The work, in spite of all its imperfections, is a grand storehouse of knowledge on points of mythology, grammar, and antiquities. All previous editions of F. are of little value compared with that of K. O. Müller (Gött. 1839), in which he has made use of the Farnese MS. and other sources, distinguishing the value of each.

FE'TIALES, or FECIALES, Roman officers who acted in international affairs as heralds in the announcement of war to a foreign state, and by presiding over the solemnities attending the return of peace. Their duties were discharged with much ceremony. They were anciently citizens of high birth, were chosen for life, and were called *patres patrati.*

FETICHISM is the worship of a *fetich.* The word fetich comes to us from the Portuguese, who were the first Europeans that traded on the w. coast of Africa, and who expressed their idea of the religion of the natives by the Portuguese word *feitiçao,* "magic." This word, somewhat modified, passed into the French language, through Brosse's treatise, *Du Culte des Dieux Fétiches* (Dijon, 1760), and from him into German, through the medium of Pistorius (Stralsund, 1785). The term has now received European recognition. A fetich is anything in nature or art to which a magical power is ascribed, e.g., stones, carved figures, or certain parts of plants, animals, etc. In this general sense F. coincides with the belief in charms—a belief which is also to be found among monotheistic nations. The first step *out of fetichism,* is when ignorant tribes cease to be satisfied with believing merely in the magical power inherent in their fetiches, and begin to ascribe a certain conscious operation to the objects of their reverence, especially to the fetiches in the forms of beasts or men. In this way the fetich becomes an idol, and F. an idolatry. The lowest form of such idolatry is where the savage does not hesitate to throw away, to chastise, or even to destroy his fetich, if it does not appear to gratify his desires. The reverence for sacred woods, mountains, streams, etc., which formed part of the religion of the old Greeks, Celts, and Germans, is not F. proper, but rather belongs to the worship of nature.

FE'TID LIMESTONE, a variety of limestone which gives out on being violently rubbed or struck with a hammer, a smell like that of sulphureted hydrogen gas. It has a dark color, produced very probably from the perishable portions of the animals whose hard skeletons compose the rock. This animal matter may perhaps also be the cause of the disagreeable smell. Stinkstone or swinestone has been likewise employed as characteristic names for this limestone.

FÉTIS, FRANÇOIS JOSEPH, 1784–1871. He was the son of an organist, and played the organ in his native town (Mons, Belgium), when only 10 years of age. He received his musical education from the leading teachers at Paris, and then traveled in Germany and Italy, studying the works of the great masters. In 1806, he returned to Paris, married a wealthy lady, and was enabled to devote his time to studying the history of music. In 1813, financial misfortunes compelled him to return to the practice of his profession, and he accepted the position of organist and instructor at Douai. In 1818, he became a professor in the conservatory of Paris, and published about this time his *Traité du Contrepoint et de la Fugue.* In 1827, he founded and edited the *Revue Musicale,* a journal devoted to musical criticism. The time that he could spare from professional duties was devoted to researches upon the theory of harmony, to the preparation of articles for a number of journals, and to the composition of operas and pieces of sacred music. In 1833, he was appointed chapel master and director of the royal conservatory of Brussels. In 1864, according to instructions left in the will of Meyerbeer, he became his musical executor, and superintended the production of the opera *L'Africaine.* The most successful of his own operas was *La Vielle,* which had a run of 100 nights. His principal works are: *Biographie Universelle des Musiciens et Bibliographie Générale de la Musique,* and his *Traite Complet de la Théorie et de la Pratique de l'Harmonie contenant la Doctrine de la Science et de l'Art.*

FETLOCK, or FETTERLOCK. English heraldic writers speak of a horse fetlock or fetterlock, and represent it thus. It seems to have been an instrument fixed on the leg of

a horse when put to pasture, for the purpose of preventing him from running off. In Scotch heraldry, a hoop is usually substituted for the chain, and the fetlock is represented as in the arms of Lokkert (Lockhart) of Barre, given by sir David Lindsay; Argent, on a bend sable three fetterlocks *or*. Some branches of this family carry a man's heart within the fetterlock, one of the heads of it having accompanied good sir James Douglas with king Robert the Bruce's heart to Jerusalem (Nisbet, i. p. 325).

FEUD (Angl -Sax. *fœght*) seems to be only another form of the word *fight*, and is allied to *foe*, and probably to *fiend*. It meant a war waged by one family or small tribe on another, to avenge the death or other injury of one of its members. In a certain state of society, this is a legitimate mode of obtaining redress. It prevailed extensively among the nations of Northern Europe; and it was only by gradual steps that the practice was first restricted and then abolished. The laws of Rudolf I. of Germany recognized the right of waging feuds. At last, partial associations were formed, the members of which bound themselves mutually to settle their differences by courts of arbitration and compensation, without going to war.

FEUDAL SYSTEM. By some, the word feu or feud, of which feudal is the adjective, is derived from the Lat. *fides*, faith, and *ead* or *odh*, or *od*, a Teutonic word signifying a property, or estate, in land; whilst by others, with perhaps greater probability, the first syllable also is maintained to be Teutonic, equivalent to *vieh*, cattle, ultimately from the same root with the Latin *pecus*, which, in the form of pecunia, came to signify property, and its representative, money—because, as Varro remarks, property amongst pastoral nations consisted of cattle (Varr., *De Lingua Latina*, 5, 19, s. 95, ed. Müll). A feudum, in this sense, would be a piece of land held for a *fee*, or pecuniary consideration, using pecuniary in the wide sense which its etymology suggests. Be this as it may, the feudal system, as a developed institution, belonged neither to the Teutonic nor to the Romanic nations, in their original and unmixed condition. We find it neither in the woods of Germany, nor in the Roman empire previous to the incursions of the Franks and Lombards. Neither the institutions described by Tacitus, nor those with which the Roman jurists have rendered us familiar, exhibit anything that is even analogous to it as a whole. But they each exhibit partial indications of some of the characteristics which most peculiarly distinguish it; and as it arose about the beginning of the 9th c., just when the fusion between the conquering barbarians and the subject populations of the Romanized provinces was everywhere taking place, it seems impossible to doubt that it was a result of the mutual influence of the two races. The subordination of class to class, and the intimate relations by which all the classes of the community were bound together, taken along with the independence and equality of the individual members of each class within itself, were amongst the most prominent features of the simple society of the Teutonic nations; and these correspond with wonderful accuracy to the relations of superior and vassal, beginning with the sovereign and descending to the smallest feudal proprietor, and also with the equality amongst *peers*, which existed within each of the feudal classes. On the other hand, the incomplete and fiduciary character of the proprietorship implied in a *feu*, as held in trust from a superior on the faith of services to be rendered, or dues to be paid, bore a very close analogy to the Roman emphyteusis (from which indeed the word feu has often been derived), and to the *dominium utile* as opposed to the *dominium directum*. See DOMINIUM and EMPHYTEUSIS.

The nature of this very important social institution, by which the life of every European people of any importance was governed from the beginning of the 9th till the close of the 13th c., and by which many of the forms of our modern life are still affected, will probably be more clearly understood if we commence our description of it from below, by exhibiting the position of the simple land-holder, than by adopting the monarch in whom it culminated, and from whom, in a technical sense, it was supposed to flow (see ALLODIAL), as our point of departure. The latter course has been more strictly adhered to by English writers, from the circumstance that, subsequent to the conquest, the whole territory of England was regarded as the property of the conqueror, and was by him divided amongst his barons, and by them amongst their dependents, an arrangement which was somewhat peculiar to England (see ALLODIAL), whereas the feudal system, in its essentials, was common to the whole of Europe. A feudal proprietor, then, or feudatory, was a person who held his lands from another, for his own life-time merely, in the earlier times, on condition of certain services which he was to perform to a superior or suzerain. Apart from the duties to which he was thus bound, he was not only a free man, but his position was that almost of an independent sovereign within his own small dominions. If his holding was at all an extensive one, he lived in a castle, which, notwithstanding the efforts of Charlemagne and his successors to prevent it, was generally fortified, not only for purposes of defense, but to enable him to pursue that life of rapine which in lawless times was not considered inconsistent with honesty or personal worth. For greater security, the castle was generally situated on a height, and under its walls there nestled a village, in which all the dependents of the proprietor, with the exception of his immediate family, and all those who lived by the cultivation of the soil, usually dwelt—isolated farm-houses and cottages being too much exposed to plunder to admit of their being scattered over the country then, as we see

them in England now. A portion of the inhabitants of each feudal domain were usually bound to the soil, and were thus subject to a species of slavery, the conditions of which varied according to the customs of different districts. These were spoken of as *adscripti* or *adscriptitii glebæ*, and were called *nativi*, or bond-men, and *villein-socmen*, as opposed to free soc-men on the one hand and serfs or *theowes* on the other, of whose position we shall speak below. (Stephen's *Com.* i. p. 188.) "He was," says sir Francis Palgrave, speaking of the ceorl, "a villain appurtenant; and, notwithstanding the language which was employed (to the effect, namely, that he could be bequeathed, bought, and sold). it must be understood that the gift, the bequest, or the sale, was in effect the disposition of the land and of the ceorl, and of the services which the ceorl performed for the land, a transaction widely differing from the transfer of a slave, whose person is the subject of the purchase." (*Rise and Progress of the English Commonwealth*, vol. i. p. 18.) The ceorl, moreover, could purchase his own freedom and that of his wife and offspring (*Ib.*). See VILLEIN. The rest were free tenants, farmers in the modern sense, though personal services to the proprietor probably in almost every case constituted a portion of the rent which was paid. Latterly, when the system of subinfeudation was introduced, many of his wealthier tenants came to stand to the baron, or lord of the domain, very much in the relation which we are about to describe as subsisting between him and his lord paramount. From being tenants-at-will, scarcely less subject to his authority and exposed to his caprices than the thralls, or villeins of the lowest class, they became vassals of their lord, and free citizens of what thus gradually developed itself into a feudal monarchy in miniature. The tenure by which this latter class held their lands was generally known in England as free socage (Stephen's *ut sup.* i. 205 *et seq.*). The castles by which the banks of the Rhine are studded along its whole course, from Bonn to Bingen, with their villages and parish churches, for the most part in the condition in which they were erected centuries ago, afford the most numerous and perfect examples of the arrangements of the feudal period which are perhaps anywhere to be met with. The possessors of these castles stood in a magisterial as well as a proprietary relation to their dependents. They exercised jurisdiction, extending even to the infliction of capital punishment, either in person or by means of officers whom they appointed for the purpose; and the castle was in general furnished with dungeons and other appliances for carrying their sentences into execution. Towards each other they stood in the relation of equals, or peers (Lat. *pares*); they were neighbors, simply, and friends or enemies as the case might be—too often the latter. But towards their immediate feudal superior, the count, marquis, duke, or whatever might be his title, to whom the government of the whole district belonged, they all stood in a relation which brought them in contact, and in some degree bound them to each other. Of him they held their lands on conditions somewhat similar to those on which they let them out to their own dependents. At first, as we have said, they were only tenants for life; but their rights in most countries very early assumed a hereditary character, the dominant proprietor's rights, on the death of a tenant, being confined to the exaction of certain dues from his son and successor, as a consideration for conferring on him, or rather for confirming to him, the feu which his father had held. Where the feu, fief or feoff, as it was sometimes called from the mode of admission—feoffment, or as it is said in Scotland, infeftment (q.v.)—descended to a female, the dominant proprietor was entitled to control her marriage, for the purpose of procuring himself a sufficient and trustworthy vassal; a privilege which, like all those of the lord, was latterly converted into a mere pecuniary claim. When the lord paramount, or suzerain, as he was called, held his court of justice, his vassal barons were the judges, being all on a footing of equality, or *pares curiæ*, as it was called. When he made war, either on his own account, or as furnishing a contingent to the army of the state, in such cases as in the national wars between France and England in the 12th and 13th centuries—which were the earliest instances of really national wars—his vassals were bound to attend him in person, and to furnish each the contribution of men, horses, arms, and other materials of war for which he was liable by the tenure on which he held his lands. In addition to these services, he was bound to watch and ward his castle, a duty which the minor barons almost invariably imposed on their vassals when the system of granting feus extended downwards to the class of persons who had formerly been mere tenants-at-will. Then there were certain dues which were almost always exigible from the vassal, such, e.g., as contributions towards providing a ransom for his lord when in captivity, for enabling him to celebrate the marriage of his eldest son with due pomp, or to provide a suitable dowry for his daughter. If these dues were not paid, the land reverted to the dominant proprietor, in relation to whom the vassal all along was a mere usufructuary. So far were the conditions of feudal holdings from being always the same, that no less than eighty different tenures have been enumerated; the onerous character of which varied from what was merely nominal, e.g., the payment of a white rose or a pair of spurs, "if asked merely," up to what was a rent in some degree equivalent to the value of the land. For an account of the manner in which the feudal system affected the constitution of land rights and the conveyance of landed property, and still affects them, see CONVEYANCING.

Inferior to all the classes of society in feudal Europe of which we have hitherto spoken, there is reason to fear that there existed almost everywhere, in the earlier times,

a class of the positively unfree. The lot of those who were in absolute slavery excluded them from the influences of feudality as a legal and social institution—"they were not reckoned," says Palgrave, "amongst the people"—but their existence is by no means to be left out of account, in forming to ourselves a picture of European society in feudal times. Of the condition of this class, as forming the substratum of feudal society, we shall have a pretty accurate conception from the following passage, in which Lappenberg describes them in Anglo-Saxon times, if we bear in mind, on the one hand, that subsequently to the conquest their ranks were probably swelled by such of the Anglo-Saxon population as was in absolute poverty; and on the other, that their position, in all the countries of Europe, was gradually ameliorated by the influences of Christianity, the spirit if not the letter of which has everywhere proved hostile to slavery. "One class of the Anglo-Saxon population, at the period of the Norman conquest, consisted of the unfree or servile (*theowas, esnas*), whose number, as registered in domesday-book, was little above 25,000. Of these, the majority were in a state of slavery by birth, whose forefathers had been either Roman slaves, British prisoners of war, or other enemies. Others, denominated *wite-theowas*, or penal slaves, had been freemen, but reduced by the sentence of the law to the servile condition, on account of debt or delinquency. (Palgrave *ut sup.* i. 28.) The master had the right of selling the theow in the country, but not beyond the sea, even if he had perpetrated crime. In other respects, the condition of the servile seems to have differed little from that of the indigent free slaves who had a special wergild, half of which fell to the master and half to the kin." (Thorpe's Lappenberg, ii. p. 320. It is probable that the vast majority of the servile class in Anglo-Saxon, and even in Norman times, consisted of persons of Celtic blood. (Palgrave *ut sup.* p. 26.) In proof of this fact, Lappenberg remarks that their numbers diminish as we recede from the Welsh border and from Cornwall, the places in which the Celtic or original British population is known to have taken refuge.

The social elements which counteracted and mitigated the influences of feudality in mediæval life, were monarchy, the church, which vigorously promoted the emancipation of the unfree, and above all, the growing wealth, power, and importance of the commons. In order to free himself from the rude and insolent dictation of his great feudal vassals, the king, in almost every European state, courted the alliance of the town communties, who had remained more in the condition in which they had been left by the Romans than the inhabitants of the country, and who were consequently all along more or less opposed to the growth and influences of feudality. See MUNICIPIUM. By their aid, even before the formation of standing armies, something approaching to executive power was placed in the hands of the sovereign. He was thus enabled to appoint and enforce the decrees of independent judges of his own, who in the earlier times were generally churchmen, and thus greatly to circumscribe the power and influence of all classes of feudal proprietors over their dependents. Though the period of bloom of the F. S. was, as we have said, from the 9th to the 13th centuries, in most of the countries of Europe, it everywhere, in many of its features, long survived the latter period. Even considered as a social, and not merely as a legal institution, in which latter capacity it still exists, it was in many respects in vigor in Scotland down to the year 1747, when military tenures were abolished by statute, as dangerous to public tranquillity.

FEU DE JOIE, or "running fire," a discharge of musketry into the air, made in honor of a victory or other great occasion. It commences with the right-hand man of the line, who discharges his rifle, and is followed successively, at scarcely perceptible intervals, by the men on his left, until the extreme left of the line is reached. The effect much depends on the regularity with which the slight interval between the discharges is preserved.

FEUERBACH, LUDWIG ANDREAS, German philosopher, fourth son of the following, was b. at Anspach, 28th July, 1804. After studying theology for two years at Heidelberg under Paulus and Daub, in 1824 he was attracted to Berlin for the purpose of hearing Hegel, and, soon after he abandoned theology, with the view of devoting himself entirely to philosophy. In 1828, he became *privatdocent* in the university of Erlangen, but in a few years quitted the academical chair, and gave up his whole time to literary labor. In a small anonymous work (*Gedanken über Tod und Unsterblichkeit*, Nürnberg, 1830), which attracted little attention when it appeared, he indicated that he had already gone beyond the stand-point of his master Hegel, by combating the doctrine of immortality. During the next few years, he published three works on portions of the history of philosophy, treating severally of the period between Bacon and Spinoza, of Liebnitz and of Pierre Bayle. But these historical works only paved the way to a critical investigation into the nature of religion and its relation to philosophy, the results of which have been given to the world in several works well known to speculative theologians. The most celebrated of these is his work on the Nature of Christianity (*Das Wesen des Christenthums*, Leip. 1841; 2 Aufl. 1843), which has been translated into English. Starting from the Hegelian doctrine, that the absolute comes to consciousness only in humanity, F. denies to it any existence beyond the human consciousness, maintaining it to be merely the projection by man of his own ideal into the objective world, on which he feels his dependence. All authority above man, and consequently all moral obligation, is therefore consist-

ently regarded as a delusion proceeding from man himself, and the highest good is explained as that which is on the whole most pleasurable. Yet even this highest good is further explained as consisting in resemblance to that ideal humanity which man creates for himself, and worships as God. A kind of ideal theism is therefore retained by F.; but when his doctrines were adopted by the mass of German communists, they degenerated, perhaps logically, into an actual atheism, which ignored any moral or social law imposed on the individual from any other source than himself.—The works of F. have been collected, with additions and corrections to bring them into accordance with his later views (*F.'s Sämmtliche Werke*, 10 Bde., Leip. 1846-66). He died 13th Sept., 1872. See Karl Grün's *Ludwig F.* (1874), and Beyer's *Leben und Geist F.'s* (1873).

FEUERBACH, PAUL JOHANN ANSELM, RITTER VON, one of the most distinguished criminal jurists of Germany, was b. at Jena, 14th Nov., 1775. Brought up at Frankfort-on-the-Main, where his father was an advocate, and educated in the gymnasium there, he went in 1792 to Jena, where he cultivated his mind by the study of philosophy, and then devoted himself to positive law. In 1798, he appeared as criminal jurist in a work *On the Crime of High Treason*, and in the following year he began to deliver lectures in the university of Jena. In his lectures and published writings, he introduced into criminal jurisprudence a new method of treatment, which was systematized in his compendium of German penal law (*Lehrbuch des Gemeinen, in Deutschland geltenden peinlichen Privatrechts*, Giessen, 1801; 14 Aufl. von Mittermaier, 1874). This celebrated work placed F. at the head of a new school of jurists, who maintain that the decision of the judge in every case ought to be determined solely by an express deliverance of the penal law, never by his own discretion, and who on that account obtained the name of rigorists. In 1801, F. was appointed ordinary professor in Jena, but in 1802 accepted a call to Kiel. In 1804, he was removed to the university of Landshut; but next year, having received a commission to prepare a penal code for Bavaria, he was transferred to Munich as privy referendary for the ministerial, judicial, and police departments; and in 1808 was appointed privy-councilor. The new penal code which he planned for Bavaria (*Strafgesetzbuch für das Königreich Baiern*, München, 1813), received, after a few modifications, the royal approval, and was taken as a basis in the emendation of the criminal law of several other countries. During this period also, he published his Remarkable Cases in Criminal Law (*Merkwürdige Criminalrechtsfälle*, 2 Bde., Giessen, 1808–11), which first led the way to a deeper psychological treatment of such cases. In 1812, he published a work on trial by jury, to which a second volume, on the judicial procedure of France, was added in 1825, as the result of a visit to Paris in 1821. In 1817, he became second president of the court of appeal in Bamberg, and afterwards first president of the court of appeal at Anspach for the Rezat district. In 1832, he published a work on the unfortunate Kaspar Hauser, whose mysterious fate had strongly attracted his interest. He had just edited a collection of his miscellaneous writings, when he died at Frankfort-on the Main, 25th May, 1833. An interesting life of F. has been written by his son, Ludwig (*Leben und Wirken Anselm von Feuerbachs*, 2 Bde., Leip. 1852). F. left, besides three daughters, five sons, who have all distinguished themselves in German literature.

FEU AND FEU-DUTY. A feu may be described, in familiar language, as a right to the use and enjoyment of lands, houses, or other heritable subjects, in perpetuity, in consideration of an annual payment in grain or money, called *feu-duty*, and certain other contingent burdens called casualities of superiority (see CASUALITY). Though a feu was frequently used to express any kind of tenure by which the relation of superior and vassal was constituted, in its narrower meaning, which we have here indicated, and which is that in which it is now almost exclusively used, it was opposed, on the one hand, to those tenures in which the return consisted of military or other personal service (ward and the like), and, on the other, to those in which the return was illusory (blanch), the only object of which was to preserve the relation of superior and vassal. A feu, in short, was a perpetual lease—a feu-farm, as it was often called—by which the tenant became bound to pay a substantial consideration, and his rights under which he might forfeit, as the penalty of non-payment. In the present day, the disposal of land in feu is practically a sale for a stipulated annual payment, equivalent to chief rent. It is in this light, accordingly, that feus are generally regarded in Scotland; and though feus resemble English freeholds in substance, their forms agree mostly with copyhold tenure. See Paterson's *Compendium of English and Scotch Law*. The system of feuing property for building purposes seems to have several advantages over that of the long building-leases common in England. From its perpetual character, it gives to the person actually in possession a feeling of greater interest in the property, and usually leads him to erect more enduring structures than he probably would do under a lease. For as time runs on, the feu often increases in value, while the reverse must always be the case with leasehold property. Neither does it in any degree interfere with the letting of property on lease or otherwise. Almost all the houses in Edinburgh and the other towns in Scotland which are let, either on leases or from year to year, are held by those who are spoken of as their proprietors not in absolute property, but as feus. Modern feu-duties are in general paid in money. When the stipulation is for a duty in grain, the quantity is valued by fiar prices for the year (see FIARS), and paid in money accordingly. The deed transferring the land in feu from the superior to the vassal is called a feu-charter

—a clumsily conceived and expensive document, which requires renewal in the case of heirs to vassals, or of parties to whom the vassal sells his right; and this repetition of the transaction, designated as "entering with the superior," forms the heavy drawback on the acquisition of land in feu, no matter how small in amount. Usually, the feu-charter reserves to the superior all minerals in the ground, and stipulates that the vassal shall build his house either in a particular style or of a certain value. By the Scottish stat. 1597 c. 246, it is declared that all vassals by feu-farm failing to pay their feu-duty for two years together, shall lose their right, in the same manner as if an irritant clause had been specially engrossed in their charter. But as the superior must obtain a decree declaring the loss of the vassal's right, before the forfeiture can take effect, if the feu is worth keeping, the duties, as a matter of course, will be paid. In the very rare case of the property having fallen off in value to the extent of rendering the feu a positive burden, it is possible that the irritancy may be voluntarily incurred. For the most part, land proprietors near towns and manufacturing villages are anxious to add to their annual rental by feuing grounds for building purposes. The rate of feu is very various, from as low as £8 to as high as £500 per acre per annum; a common rate is from £20 to £30 per acre. Whatever be the amount, it is payable by the feuar—not the tenant to whom the feuar may have let the property. When a building consists of several floors forming distinct dwellings, the feu-duty is allocated in certain proportions among the respective proprietors; the feuar to whom the lower floor belongs usually paying most. In properties of this kind, each is responsible only for his own share. Occasionally, feu-duties are offered for sale; and as a safe investment, bring from 25 to 30 years' purchase. In such cases, the vassal has an opportunity of extinguishing his feudal tenure, and becoming the superior. There are also instances of vassals sub-feuing. It is customary in feuing building lands for the superior to make the roads and drains. Relieved of this obligation, and getting possession of a site on a mere prospective annual payment of perhaps only a few shillings, the feuar has an undoubted advantage; looking, however, to the cumbersomeness and cost of the feu-charters, and the liability of successors to pay fines at entry, the system is entangled, troublesome, and expensive; and, at least as far as forms are concerned, is allowed to stand in need of reform.

FEUILLANS, CONGREGATION OF, a reform of the Cistercian order, remarkable as forming part of the great religious movement in the Roman Catholic church during the 16th c., contemporary with and probably stimulated by the progress of the reformation. The author of this reform was Jean de la Barriere, abbot of the Cistercian monastery of Feuillans, who, painfully struck by the relaxation of its discipline, laid down for himself a new and much more austere course of life, in which he soon found many imitators and associates among the brethren of his order. The rule thus reformed was, after considerable opposition from the advocates of the old rule, approved, with certain modifications, by pope Sixtus V.; the reformed congregation, however, being still left subject to the authority of the abbot of Citeaux; and a convent was founded for them by Henry III. in the Rue St. Honoré, Paris. The subjection to the abbot of Citeaux was removed by Clement VIII. in 1595; and Urban VII., in 1630, separated the congregation into two branches, one for France, and the other for Italy, each under a distinct general. The rules of both these branches were subsequently modified about the middle of the same century.

The celebrated revolutionary club of the Feuillants took its name from this order, the convent of which, in the rue St. Honoré, was the place of meeting for the members of the club. It was founded in 1790 by Lafayette, Sièyes, La Rochefoucauld, and others holding moderate opinions. The club was at first called the "Company of 1789," and was intended to support the constitution against the ultra party. It reckoned among its members individuals of all classes, who took the constitution of England as their model. This opposition served, however, only to accelerate the revolutionary movement. On the 27th Jan., 1791, on count Clermont Tonnerre being elected president of the club, a popular insurrection broke out against it; and, on the 28th Mar., the assembly in the cloister was forcibly dispersed by a raging mob.

FEUIL'LEA, a genus of plants of the natural order *cucurbitaceæ*, named in honor of Louis Feuillée, a French botanist and traveler in Chili. The species are generally half-shrubby climbers, natives of the warm parts of America. The seeds, at least of some of them, as *F. cordifolia* and *F. trilobata*, contain a great quantity of a bitter fixed oil, which is obtained by expression, and is used for lamps. It has also a high reputation in the West Indies and Brazil as a cure for serpent bites, and an antidote to some kinds of vegetable poisons.

FEUILLET, OCTAVE, b. 1812; a French novelist and dramatist; was educated in the college of Louis-le-Grand, of Paris. His early writings were published under the name of "Désiré Hazard," *Le Grand Vieillard*, written in 1844, conjointly with Paul Bocage and Albert Aubert, being the first. Feuillet afterwards became a constant contributor to newspapers and reviews, besides writing many comedies, dramas, and farces, which achieved popularity. He was elected to the French academy in 1862, and in the following year was made an officer of the legion of honor. Afterwards he was appointed librarian of the imperial residences, which position he held until the revolution of Sept., 1870. His most noteworthy dramatic productions are: *La Nuit Terrible; Le Bourgeois de Rome;*

La Crise; Le Pour et la Contre; Péril en la Demeure; La Fée; Le Village; Dalila; Le Roman d'un Jeune Homme Pauvre; La Tentation; La Rédemption; Montjoye; La Belle au Bois Dormant; Le Cas de Conscience; Julie; La Clé d'Or, a comic opera; and *L'Acrobate*. Among his novels are *Polichinelle*; *Onesta; Rédemption; Bellah; Le Cheveu Blanc; La Petite Comtesse; Le Roman d'un Jeune Homme Pauvre*, which has been translated into many languages; *Histoire de Sibylle; Monsieur de Camors*, a story remarkable for invention and vigor; *Julia de Trécœur; Un Marriage dans la Monde;* and *Le Journal d'un Femme*. He is also the author, jointly with Paul Bocage, of a number of other dramas, and has published several poems.

FEUILLETON (Fr.), literally a small leaf, signifies that portion of a political newspaper set apart for intelligence of a non-political character, for criticisms on art, literature, etc., and usually separated from the main sheet by a line. The F. is an invention of the *Journal des Débats*, which, since the year 1800, has held an important place in the sphere of literary criticism. By degrees, the belles-lettres element began to pervade it; and the result was a species of light journalistic literature, in which Jules Janin became the acknowledged king. In the years immediately preceding the revolution, Feb., 1848, entire romances were spun out in the feuilleton. The *Constitutionnel*, in particular, made large pecuniary profits by the social romances of Eugene Sue, which it published in this manner. The French system has been imitated in England and Germany, though with less success than in France.

FÉVAL, Paul Henri Corentin, b. 1817; a French writer of fiction, bred to the law, which he soon abandoned for authorship. His novels are numerous, and a number of them have appeared in English, among them *The Loves of Paris; The Duke's Motto; The Woman of Mystery; Thrice Dead*, etc. In 1876, he became a Roman Catholic, and wrote in defense of the Jesuits.

FEVE'DA, an island of British Columbia, is situated in the gulf of Georgia, between Vancouver island and the continent. It is in lat. 49° 41′ n., and long. 124° w., measuring 32 m. in length by 2 in average breadth. It possesses a snug little harbor, which appears to be all the more valuable on account of the superior quality of the fuel which abounds on the spot. Its formation is understood to be wholly of limestone.

FEVER (Lat. *fĕbris*, from *ferveō*, I grow warm, or perhaps from *februō*, I cleanse), a form of disease characterized principally by increase of the temperature of the body, which, however, requires to be estimated according to the state of the internal parts, rather than the external; the surface of the body, and particularly of the extremities, being not unfrequently cold rather than warm. Having regard to the heat of the surface only, F. has commonly been considered as passing through three distinct stages, more or less marked: 1, the cold or shivering stage; 2, the hot stage; 3, the sweating stage. This description is perfectly correct in most cases, but it requires to be qualified by the remark, that even in the cold stage of fevers, it is now well ascertained that the blood and the internal organs have an elevated temperature, as estimated by the thermometer introduced into the cavities of the body. In the cold stage of F., accordingly, and even in the most violent ague, when the teeth are chattering with cold, and the whole surface is pale and clammy, the state of the system is well expressed by the aphorism of Virchow (the most ingenious and comprehensive of the modern exponents of the pathology of F.), to the effect that "the outer parts freeze while the inner burn." Increased heat of the body, therefore, is the most essential, perhaps the only essential phenomenon of fever. The other symptoms are loss of appetite, thirst, restlessness, and vague general uneasiness, often headache, and diffused pains in the back and limbs; a frequent pulse, which is sometimes also full and hard; a furred tongue, often with red margin; a flushed face and suffused eyes; vitiated secretions, and general derangement of the functions, with great debility of the voluntary movements of the limbs. The disease often commences with a shivering, or rigor, as it is technically called; this leads through the cold stage to the hot, which usually follows pretty rapidly, and is attended by all the febrile phenomena in their highest degree; the skin being often very pungently warm to the hand, dry, and harsh; by and by, the pores appear to open, moisture begins to bedew the surface, and the pungent heat disappears: the disease is then about to pass into its third or sweating stage, which ushers in the convalescence. For the special symptoms of particular fevers, see Typhus and Typhoid Fevers, Small-pox, Scarlet Fever, Measles, Ague, Intermittent and Remittent Fever, Yellow Fever.

Besides being thus the leading fact in a number of specific diseases, F. is also associated with many other forms of disease as a secondary or subordinate phenomenon, connected with an inflammation or other distinctly local disease. Thus, in pneumonia (q.v.) or enteritis (q.v.), F. is as much a part of the symptoms as pain or any other; and even in some chronic or long-standing diseases, as in consumption (q.v.), a slow and consuming type of F. (see Hectic Fever) is found to be very generally present. Indeed, there is no condition which rules so large a part of the physician's duty, whether in the way of distinguishing diseases or of curing them, as this constitutional state. F. is also very generally prevalent after surgical operations and injuries, of which it constitutes one of the leading dangers; and in midwifery practice, it is well known as constituting a large part of the risks of the puerperal state, whether in the slighter form commonly

called *a weed*, or in the more dreaded and fatal, often epidemic, form of puerperal fever (q.v.)

The family of fevers is thus separated pretty naturally into two large groups, in one of which the F. is the greatly predominating fact, and determines the specific character of the disease: the local disease (if present) being quite subordinate, and usually secondary in point of time; the other, where the opposite order prevails, and the F. is obviously secondary. Hence the distinction embodied in medical language between *idiopathic* (i.e., self-originating, spontaneous), and *symptomatic* or secondary fevers. Fevers are also distinguished, with reference to their mode of diffusion, as epidemic (q.v.) and endemic (q.v.); or with reference to their supposed cause, as contagious, infectious, malarious, pneumonic, rheumatic, etc.; or with reference to their incidental symptoms and their peculiarities of course and termination (the presumed *specific* phenomena attracting, of course, particular attention), as eruptive (see EXANTHEMATA) or non-eruptive, bilious, gastric, enteric, mucous, putrid, malignant, typhoid, etc.

Among these distinctions, based upon the course of the F., one demands particular notice, as involving an important law of febrile diseases generally, and of a large class of fevers of warm climates in particular. Periodic increase and diminution, or paroxysms of longer or shorter duration, with intervals of more or less perfect relief from all the symptoms, are characteristic of most diseases of this kind, but especially of those arising from *malaria*, i.e., emanations from the soil, educed under the influence of solar heat. The duration of the paroxysms and of the intervals, the complete *intermission*, or more partial *remission*, of symptoms, become in such cases the characteristic facts that mark the *type*, as it is called, of the F., which is accordingly distinguished as intermittent, remittent, or continued; and, according to the length of the periods, Tertian, Quartan, Quotidian, etc. (q.v.).

The true pathology, or ultimate essence of the febrile state, is still a subject open to question; but it is in accordance with modern physiology to regard F. as connected with some complex derangement of the functions on which the animal heat is known to depend—viz., the nutrition of the textures, or the vital changes constantly in operation between the blood, on the one hand, and the ultimate atoms of solid texture, on the other. Recent observations have shown that, in the paroxysm of ague, the waste of the nitrogenous tissues is in excess; and further, the curious result appears to be arrived at, that for almost every grain of excretion representing this excess of waste in a given time, there is a proportional increase of the temperature of the blood, according to accurate thermometric observations. If such observations are corroborated and extended, it will probably appear that the cause of F. is to be found in an increased destructive decomposition of the atoms of texture through the oxygen absorbed at the lungs and circulated with the blood; perhaps under the influence of a derangement of nervous system; which has been shown by experiment to have a very marked control over the generation of animal heat.

The treatment of F. will be considered under the separate forms already referred to.

FEVER BUSH, a shrub common in the northern states, remarkable for graceful form and beautiful leaves; the *benzoin odoriferum* of Nees. It is from 4 to 10 ft. high, and grows best in moist and shady places. A decoction of the twigs is used as stimulant in fevers, and to cure the itching which follows vegetable poisoning. The berries have occasionally been used as a substitute for allspice, and sometimes the shrub is called spice bush.

FE'VERFEW (*pyrethrum parthenium* or *matricaria parthenium*), a perennial plant, found in waste places and near hedges in Britain and many parts of Europe. It is botanically allied to chamomile (q.v.), and still more nearly to wild chamomile (*matricaria chamomilla*), and much resembles these plants in its properties, but differs in appearance, the segments of its leaves being flat and comparatively broad, and its flowers smaller. Its habit of growth is erect, its stem much branched, and about 1 to 2 ft. high. It has a strong, somewhat aromatic smell. It was once a popular remedy in ague, and from time immemorial has been used as an emmenagogue. It is employed in infusion, and is stimulant and tonic. A double variety is not uncommon in gardens.—Of the same genus with F. is the MAYWEED (*P. inodorum* or *M. inodora*), with leaves more resembling those of chamomile, but almost scentless, and large flowers, with white ray and yellow disk, very common in cornfields and waste places in Britain and throughout Europe.

FE'VERWORT (*triosteum perforliatum*), a perennial plant of the natural order *Caprifoliaceæ*, having an erect, round, hairy, fistular stem, from 1 to 4 ft. high, opposite ovato-lanceolate entire leaves, axillary whorls of flowers, with tubular 5-lobed corolla, and leathery 3-seeded berries. It is a native of North America, where its dried and roasted berries have been occasionally used as a substitute for coffee; but it is chiefly valued for its medicinal properties, its root acting as an emetic and mild cathartic. It is sometimes called *Tinkar's root*, from Dr. Tinkar, who first brought it into notice.

FEW, WILLIAM, 1748–1828; lived in North Carolina, Georgia, and New York. He was a member of the convention to frame the constitution for Georgia; a member of the state assembly, and of the council. He was a col. in the revolution, surveyor-gen., judge of a county court, and delegate to the continental congress. He assisted in

framing the federal constitution, and in urging its adoption by his state. Subsequently, he was a member of the two constitutional (state) conventions, and United States senator.

FEZ (Ar. *Fas*), the chief and most northerly province of the empire of Morocco, occupies the country between the Atlas mountains and the Mediterranean. Its population is estimated at about 3,200,000, consisting of Berbers, Moors, Arabs, negroes, Jews, and a few Europeans. The province is divided into 15 districts.—FEZ, the capital of the province, in lat. 34° 6′ n., and long. about 5° 0′ w., was founded by Muley Edris II., in the year 808 A.D., and was reckoned during the middle ages—when it was the capital of the kingdom of Marocco—one of the most magnificent and largest cities in the Mohammedan world. It is said to have contained about 90,000 dwelling-houses and about 700 mosques, and was celebrated for its splendid public buildings, schools, and scientific institutions. On the removal of the court to Morocco, about the middle of the 16th c., F. gradually fell into decay. It is still, however, a place of considerable importance. The situation of F. is singular; it lies in a valley, formed by surrounding hills into a sort of funnel, the higher parts of which are covered with trees, orange-groves, and orchards. It is divided into Old and New F. by one of the upper branches of the Sebu, and has a population variously estimated at from 100,000 to nearly 150,000 souls. There are 100 mosques, of which the most important is that built by the sultan Muley Edris, which contains his monument, and is an inviolable refuge for criminals, however guilty. On account of its numerous mosques and relics, it is regarded as the holy city of the western Arabs. It has seven well-attended schools. The old palace of the sultan is large, but is now falling into decay. In other respects, the external aspect of F., with its numerous baths, caravanseras (of which there are about 200), and bazaars, resembles that of Mohammedan towns in general; the multitude of hotels and shops alone imparting to it a peculiar and more European character. A considerable trade is still carried on, by means of caravans, with the adjoining countries on the s. and e., extending as far as Timbuctoo. F. carries on manufactures of woolens, sashes, silk-stuffs, girdles, slippers, fine carpets, etc. Its artisans are also skillful workers in gold and jewelry.

FEZZÂN (more correctly, FESSÂN), an extensive oasis in the n. of Africa, in 24° to 31° n. lat., and 12° to 18° e. long. It lies s. of the regency of Tripoli, and has a population variously estimated at from 75,000 to 150,000 souls. The n. is for the most part hills, but the hills are composed of perfectly bare, black quartz sandstone, with no rivers or brooks among them, and the s. is mainly a level waste of dry sand. Not more than a tenth of the soil is cultivable. In the neighborhood of the villages, which are situated mainly in the wadies, wheat, barley, etc., are cultivated. Camels and horses are reared in considerable numbers. Lions, leopards, hyenas, jackals, wild-cats, porcupines, vultures, ostriches, buzzards, etc., are found in abundance. The inhabitants are a mixed race, of a brown color, in many respects resembling the negroes, but are generally well formed. The original inhabitants belonged to the *Berber* family, but since the invasion of the country by the Arabs in the 15th c., the traces of this native north African element have gradually become very faint. The language spoken is a corrupt mixture of Berber and Arabic. The people are far behind in civilization, and occupy themselves with gardening and the manufacture of the most indispensable necessaries of life. Considerable trade is carried on by means of caravans between the interior of Africa and the coast. F. is the Phazania of the ancients, against which the Romans, under Cornelius Balbus, undertook a campaign about 20 B.C. During the classic period, as well as in the middle ages, it was governed by its own princes, who were at first independent, but afterwards became tributary to the pashas of Tripoli. In the year 1842, F. was conquered by the Turks, and is now attached to the government of Tripoli. Murzuk, the capital of F., is a well-built town, with broad streets and a population of 3,000. Merchandise valued more than £21,000 annually changes hands here, and of that amount the slave-trade forms seven eighths. Murzuk is now the great starting-point from the n. for the interior of negroland. Compare Barth's *Travels in Central Africa* (Lond. 1857), and also the descriptions given of Fezzân by Denham, Clapperton, Oudney, Richardson, Dr. Vogel, etc.

FIACRE, SAINT, an anchorite said to have been a son of Eugenius IV., king of Scotland. He lived in the 7th c., and voluntarily renounced the world, going to France to counsel with St. Faro, bishop of Meaux. The bishop gave him a residence in the forest of Breuil, in Brie, where he built a cell and gave asylum to such strangers as fell in his way. After his death, about 670 A.D., his shrine had the reputation of working miracles, and pilgrimages to it began. These pilgrimages created such a demand for conveyances as to give the name of the saint to a hackney-coach, which in France is called a *fiacre*. St. Fiacre is the patron saint of gardeners.

FIAR. See FEE AND LIFE-RENT.

FIARS (a word said by Jamieson to be of Gothic origin, and to exist in the same form in Icelandic). The *fiars* prices in Scotland are the prices of the different kinds of grain of the growth of each county for the preceding crop, as fixed by the sentence of the sheriff, proceeding on the report of a jury summoned for the purpose, before whom

the evidence of farmers and corn-dealers is produced. The values thus officially ascertained serve as a rule for ascertaining the prices of grain in all contracts where they are not fixed by the parties; and in many sales it is agreed to accept the rates fixed by the fiars. Ministers' stipends, in so far as they consist of grain and crown dues, are also paid by the F. prices of the county for each year. With a view to the latter, F., in former times, were struck in the exchequer. An error in striking the F. will not afford a ground of suspension.

The form of procedure in "striking the fiars," as it is called, is regulated by act of sederunt, 21st Dec., 1723, renewed 29th Feb., 1728. The time fixed by this act for summoning the jury is between the 4th and 20th of Feb., and the verdict must be returned before 1st Mar., old style; which is generally considered too early, as before that time not much grain of the previous crop has been brought into the market. Mr. Barclay, sheriff-substitute of Perthshire, in his Digest, gives the following account of this difficult and delicate process as practiced in his county: "In Perthshire, the fiars court is held on the last Friday of Feb., or the first Friday of Mar. The jury consists of eight heritors, a few farmers, and some neutral parties, especially one or two able to check the calculations. An experienced accountant is sworn, and acts as such, but is not on the jury, and is paid a fee from the county rates. The list of the jury is shifted every alternate year, thereby giving sufficient release from duty, and yet securing persons skilled in the practice. Some years ago, it was arranged to take no juror who either paid or received rents according to the fiars; but this greatly limited the choice, and was complained of, and abandoned. All considerable dealers in Perthshire victual, whether resident in Perthshire or elsewhere, are uniformly summoned, and, in addition, every person whose name is given in by whatever person interested." As grain is commonly sold according to weight, one shilling being generally allowed on wheat for every additional pound-weight on every bushel; on an application by the farmers, it was agreed to determine the classification by taking a certain weight as the point of division. The The first thing which the jury do is consequently to determine the point of weight. The witnesses are then sworn to the schedules, which they receive after harvest, and in which they insert every separate quantity of grain sold, with the dates and prices divided into first and second classes, according as the judgment of each witness dictates, and the weight of each parcel. The results of the separate schedules are inserted by the accountant into a general schedule, which is summed up by the accountant, such members of the jury as are capable assisting him. The result constitutes the F. prices for the year. The same mode is not adopted in England; but weekly averages of *all* grain sold at public markets are ascertained and published in the *Gazette*, and this is without respect to the produce of particular counties. 9 Geo. IV. c. 60; 5 and 6 Vict. c. 14; 9 and 10 Vict. c. 22. See *Historical Account of the Striking of the Fiars in Scotland*, by George Paterson, esq., advocate, 1852.

FIAS'CO, a term borrowed from the Italian theater, and now naturalized in France and Germany, besides being occasionally used by English writers. It signifies a failure to please on the part of an actor or singer, and is thus the opposite of *furore*, although why the word, which simply means a bottle, should come to be thus applied, is more than anybody knows. In Italy, it is not uncommon to hear an audience cry out, "*Olà, olà, fiasco,*" even when the singer has only made a single false note.

FI'AT, in English law, a short order or warrant of some judge for making out or allowing certain processes.

FIBER. See MUSQUASH.

FI'BER (Lat. *fibra*), a term of very common use as applied to objects of a stringy or thread-like character, whether of the animal, vegetable, or mineral kingdom. Minerals are often described as of a fibrous structure or appearance, in which there is, however, no possibility of detaching the apparent fibers from the general mass, or in which they are inflexible and brittle if detached: but a more perfect example of mineral F. is found in *amianthus*, a variety of asbestus (q.v.). For the scientific use of F. with regard to the animal kingdom, we refer to the article MUSCLE; for its scientific use with regard to the vegetable kingdom, to VEGETABLE TISSUE and to WOOD and WOODY FIBER. In its more popular, but perfectly accurate use, it includes the hair or wool of quadrupeds, the silken threads of the cocoons of silk-worms and other insects, the fibers of the leaves and of the inner bark of plants, and the elongated cells or hairs connected with the seeds of plants, the ordinary materials of cordage and of textile fabrics.

Of mineral substances, amianthus alone has been used for textile fabrics, and that only to a very limited extent. Animal and vegetable fibers have, from the earliest ages, supplied man with cordage and with cloth. How the invention took place, can only be matter of conjecture.

The animal fibers used for textile purposes are chiefly of the two classes already mentioned—(1) the wool or hair of quadrupeds, and (2) the silk of the cocoons of insects. To these may be added (3) the byssus (q.v.) of mollusks, but this class contains only the byssus of the pinna (q.v.) of the Mediterranean, an article of ancient and high reputation, but more of curiosity than of use. The skins and intestines of animals, although sometimes twisted or plaited for various uses, can scarcely be reckoned among the

fibrous materials afforded by the animal kingdom. For information regarding the fibers obtained from the cocoons of insects, see SILK and SILKWORM. It is to the first class that the greater number of different kinds of animal F. used for textile purposes belong; and the wool of the sheep far exceeds all the rest in importance. See SHEEP and WOOL. But the wool or hair of other quadrupeds is also to some extent used, as of the goat (see GOAT and ANGORA), the alpaca (q.v.), the camel (q.v.), the bison (q.v.), the musk ox (q.v.), the yak (q.v.), and the chinchilla (q.v.); all of which, except the last—and it has but a doubtful claim to be mentioned—are, like the sheep, ruminants. The hair of comparatively few animals is sufficiently long for textile purposes, or can be procured in sufficient abundance to make it of economic importance. The warmth of clothing depends much on the fineness of the hair, and on other characters in which wool particularly excels.

The useful vegetable fibers are far more numerous and various than the animal. They are obtained from plants of natural orders very different from each other; none of them, however, belonging to the class of acrogenous or cryptogamous plants. They are obtained also from different parts of plants. Those which are derived from exogenous plants are either the fibers of the inner bark (or bast, q.v.), as flax, hemp, etc., or hairs of the fruit, as cotton. The useful fibers of endogenous plants sometimes also belong to the fruit, as coir or cocoa-nut F., and the unimportant F. of cotton-grass. The spathe of some of the palms is sometimes also sufficiently fibrous and strong to be used for bags, etc., without separation of its fibers; the fibers of the interior of the stem of old cocoa-nut palms are sometimes used for coarse purposes; the fibrous character of the stems of the slender palms called rattans, of bulrushes, etc., fits them for wicker-work, for plaiting into chair-bottoms, and the like; the roots of the *agaves* (q.v.) yield fibers useful for various purposes; but generally, the more valuable fibers obtained from endogenous plants are those of their leaves, either of the leaf-stalks—as piassaba F. and gomuto or ejoo F., both produced by palms—or of the blade of the leaf, as pine-apple F., pita flax, New Zealand flax, bowstring hemp, etc. The fibers of the leaves of endogens being parallel to each other, are easily obtained of sufficient length for economical purposes; whilst the reticulated fibers of the leaves of exogens, even if long enough, which is comparatively seldom the case, cannot be separated for use. The *bast* fibers of exogens, however, are often of sufficient length, and easily separable. Their separation is generally accomplished by steeping in water, or by frequent bedewing with water, so as to cause a partial rotting of the other parts of the bast and of the bark which covers it. But the fibers of endogens being in general discolored and injured by this process to a much greater degree than those of exogens, mere mechanical means are usually preferred for their separation, such as beating, passing between rollers, and scraping. The fibers of many leaves are separated by scraping alone. The fibers of *fruits*, as cotton, exist in nature in a separate state, like the wool or hair of animals, and require merely to be collected and cleaned.

A complete enumeration of the kinds of vegetable F. applied to economical purposes would not be easy. Flax, hemp, and cotton have long had the pre-eminence. To these have recently been added New Zealand flax, jute, sunn or sunn hemp, coir, pita flax, abaca or Manilla hemp, bowstring hemp, China grass, piassaba, and many others. New kinds are continually being brought under notice, and to this industrial exhibitions and industrial museums have most beneficially contributed. New kinds, however, do not immediately command the attention they deserve. "If a new product is sent into the market," says Dr. Royle, "few of the regular customers will buy it, as they want that to which their machinery and manufactures are suited." But for the judgment and enterprise of Mr. Salt, it might have been long ere alpaca wool had obtained its present place among the materials of our manufactures; and there is much reason to think that many vegetable fibers, now little regarded, may yet in like manner be exalted to importance.

For the use of vegetable fibers in the manufacture of paper, see PAPER.

FIBROUS PLANTS. Without attempting a complete enumeration of plants which yield fibers employed for economical purposes, we give the following as a list which may be useful. Many of the subjects will be found treated in separate articles, or more fully noticed under the natural orders. The most important are indicated by capitals.

I. EXOGENOUS PLANTS.

1. *Fibers of the Fruit.*

Nat. ord. *Malvaceæ.* COTTON, produced by species of *Gossypium.*

——— *Sterculiaceæ.* Silk-cotton, or vegetable silk, the produce of *Bombax villosum*, etc.

——— *Asclepiadaceæ.* The silk-like down of the seeds of Virginian silk (*Asclepias Syriaca*).

2. *Fibers of the Inner Bark or Bast.*

——— *Malvaceæ.* Decanee hemp (*Hibiscus cannabinus*).—Other species of *Hibiscus*, *Althæa cannabina*, *Sida abutilon*, etc.

——— *Sterculiaceæ.* A number of species of different genera; some of them cultivated to a small extent.

Nat. ord. *Tiliaceæ*. JUTE (*Corchorus olitorius, C. capsularis*, etc.).—The bast of some trees of this family, as the linden or lime (*Tilia Europæa*, etc.), is used for mats, ropes, etc. See BAST.
——— *Linaceæ*. FLAX, the produce of *Linum usitatissimum*.
——— *Leguminosæ*.—SUNN, Jubbulpore hemp, etc., the produce of species of *Crotalaria*.
Spanish broom (*Spartium junceum*).
Bokhara clover (*Melilotus arborea*).
Dhunchee (*Sesbania aculeata*).
Species of *Cytisus* (as common broom), butea, *Parkinsonia, Bauhinia*, etc.
——— *Asclepiadaceæ*. Jetee (*Marsdenia tenacissima*).
Yercum or mudar (species of *Calotropis*).
Virginian silk (*Asclepias Syriaca, A. debilis*).
Other species of several genera.
——— *Apocynaceæ*. Canadian hemp (*Apocynum cannabinum*).
——— *Urticeæ*. Common nettle (*Urtica dioica*) and other species of *Urtica*.
Species of *Bœhmeria*, one of them yielding CHINA GRASS fiber.
——— *Cannabinaceæ*. HEMP (*Cannabis sativa*).
Hop (*Humulus lupulus*).
——— *Moraceæ*. The bark of some species of fig.
——— *Coniferæ*. Inner bark and roots of some species of pine and fir.
——— Unknown. Buaze.

II. ENDOGENOUS PLANTS.

Nat. ord. *Liliaceæ*.
NEW ZEALAND FLAX, fiber of leaves of *Phormium tenax*.
Bowstring hemp, fiber of leaves of species of *Sanseviera*.
Fiber of leaves of species of *Aloë* and of *Yucca*.
——— *Amaryllideæ*. Pita flax, fiber of leaves of *Agave Americana*.
Fiber of leaves of species of fourcroya.
——— *Musaceæ*. Abaca or Manilla hemp, and plantain fiber, obtained from leaves of species of *Musa*.
——— *Bromeliaceæ*. Pine-apple fiber, curratow, etc., fibers of leaves of species of *Bromelia*, etc.
——— *Pandanaceæ*. Fibers of leaves of screw-pines.
——— *Palmaceæ*. COIR or cocoa-nut fiber, from husk of cocoa-nut. Fiber of cocoa-nut stem. Gomuto or ejoo fiber, from leaf stalks of gomuto palm (*Arenga saccharifera*).
Piassaba, from *Attalea funifera* and *Leopoldinia Piassaba* (the Chiquichiqui palm).
Other fibers from leaf-stalks, etc., of many palms.
——— *Cyperaceæ*. Fiber from leaves of *Eriophorum cannabinum* (see COTTON-GRASS). Mats, chair-bottoms, etc., made of different *Cyperaceæ*.
——— *Gramineæ* or grasses. Esparto (*Stipa tenacissima*).
Moonja (*Saccharum munja*).

FIBRINE is an organic compound, occurring both in animals and plants. In its chemical composition it closely resembles albumen and caseine, and it was until recently believed that these three substances possessed a common radical, to which the name *proteine* (from *proteno*, I am first) was given, the proteine being regarded as the primary basis of all the tissues of the body. Hence we frequently find F. described as one of the proteine bodies.

F. is mainly distinguished from the allied substances, albumen and caseine, by its separation in a solid state, in the form of extremely delicate filaments or lamellæ, from any fluid in which it is dissolved, very shortly after the abstraction of the latter from the organism.

Animal F., which is of the greatest physiological importance, occurs principally in the blood, the lymph, and the chyle. In order to obtain it in a state of purity, we beat or stir the blood with a bundle of twigs, to which the F. adheres in strings. The impure F. thus obtained is then rinsed with water, boiled with alcohol and ether—to remove fatty matters—and dried. In healthy venous blood, it scarcely ever amounts to 3 in 1000 parts, its average quantity being 2.3. Small, however, as its amount is, it varies more than any other constituent of the blood, and in acute inflammatory diseases sometimes exceeds its average by 5 or 6 times. Moreover, arterial blood contains more F. than venous blood. In the lymph and chyle, it occurs in considerably less quantity than in the blood. In inflammatory exudations, we find F. in the contents of the serous cavities—as, for example, of the pleura and peritoneum—and on the mucous membrane (as in croup); in these cases, it usually occurs in a state of spontaneous coagulation.

There are good physiological reasons for believing that F. is formed from albumen, and not directly from the food; and as F. contains a little more oxygen than albumen, it has been inferred that it is formed from the latter by a process of oxidation. As, however, more F. is found in the blood in pneumonia—when a considerable portion of

the lungs is rendered impervious to air—than in almost any other disease, we are inclined to adopt the opposite hypothesis, that the augmentation of the F. in inflammatory blood is caused by an insufficient supply of oxygen. When oxygen is abundantly introduced into the blood, the F. rapidly undergoes further transformation. on the other hand, when, in consequence of impeded respiration, the quantity of oxygen conveyed to the blood is not sufficient to effect the further normal oxidation or transformation of the F., we have an accumulation of that constituent in the circulating fluid.

It has, however, been a disputed question, whether F. is produced in the elaboration or in the disintegration of the tissues. For the discussion of this subject, and of the other points connected with F., we must refer to Lehmann's *Physiological Chemistry*, vol. i. pp. 361–364.

The substance forming the mass of flesh or muscular tissue was formerly regarded as identical with coagulated blood-fibrine. The two substances are, however, chemically distinct, and the muscle-fibrine will be described under its new chemical name, SYNTONINE (from *sunteinein*, to contract or render tense).

FIBROUS TISSUE. See TISSUES.

FICHTE, IMMANUEL HERMANN, son of Johann Gottlieb, and professor of philosophy in the university of Tübingen, was b. in 1797, and early devoted himself to philosophical studies, being attracted by the later views of his father, which he considers were essentially *theistic*. He also attended the lectures of Hegel, but felt averse to his pantheistic tendencies, and leaned more to Schleiermacher and Schelling. Occupied at first as a teacher, F. was appointed professor of philosophy in Bonn in 1836, and from 1842 to 1863 held a chair in the university of Tübingen. His chief works are *Beiträge zur Characteristik der neuern Philosophie* (1841); *Grundzüge zum Systeme der Philosophie* (1839–47); *System der Ethik* (1850); *Anthropologie* (1856); *Psychologie* (1864); *Vermischte Schriften* (1869); etc. He suggested meetings of philosophers similar to those held by physicists; and at the one held at Gotha, 1847, he delivered an address *On the Philosophy of the Future* (Stuttg. 1847). The great aim of his speculations has been to find a philosophic basis for the personality of God, and for his theory on this subject he has proposed the term *concrete theism*, to distinguish it alike from the abstract theism which makes God almost an unreality—a barren aggregate of lifeless attributes; and on the other hand, from the all-absorbing pantheism of Hegel, which swallows up the human and the divine in its own inapprehensible totality. Some time ago, F. published an important work, *Zur Seelenfrage, eine Philosophische Confession*, which has been translated into English by J. D. Morell, under the title of *Contributions to Mental Philosophy* (1860), for an account of which see art. CONSCIOUSNESS. During the movements of 1848, he issued several political tracts. The principle of F.'s politics is not unlike Dr. Arnold's maxim. He holds that there is only one kind of real conservatism, that of constant well-planned reform; and that all revolution consists either in attempts to precipitate prematurely the future, or to go back to ideas that are effete, the last being only the chrysalis form of the first. The state, "according to the idea of benevolence," belongs to the future. The regeneration of Christianity would consist in its becoming the vital and organizing power in the state, instead of being occupied solely, as heretofore, with the salvation of individuals. To this recent school of philosophy belong Weisse, Chalybœus, Wirth, and others.

FI'CHTĒ, JOHANN GOTTLIEB, an illustrious German philosopher, was b. at Rammenau, in upper Lusatia, 19th May, 1762. His earliest years were marked by a love of solitary musing and meditation. When a mere child, he was wont to wander forth to upland fields, that he might enjoy the pleasure of gazing into the illimitable distance. In 1775, he was placed at the gymnasium of Pforta, near Naumberg; and in 1780 he entered the university of Jena, where he devoted himself at first to theology, but afterwards to philosophy. During the years 1784 to 1788, he supported himself in a precarious way as tutor in various Saxon families. Subsequently, he went to Zurich in a similar capacity, where he made the acquaintance of the excellent lady who afterwards became his wife, Johanna Maria Rahn. In 1791, F. obtained a tutorship at Warsaw, in the house of a Polish nobleman. The situation, however, proved disagreeable, and was thrown up by the fastidious philosopher, who next proceeded to Königsberg, where he had an interview with Kant, of whom he had become an ardent disciple. Here he wrote, in 1792, his *Kritik aller Offenbarung* (Critique of all Revelation), which he showed to that philosopher, who praised it highly, but still maintained a certain air of reserve towards the enthusiastically earnest author, which pained the latter greatly. At Königsberg, F. was reduced to such straits for want of the means of subsistence, that he was forced to ask the loan of a small sum of money from Kant, which the latter was stoical enough to refuse. Things were now at the worst with F., and of course—according to the old adage—they began to mend. He entered the delightful family of the count of Krokow, near Danzig, as tutor, was enabled to marry; and in 1794, was appointed to the chair of philosophy at Jena, where he commenced to expound with extraordinary zeal his system of trancendental idealsm. F., in fact, *preached* his philosophy as if he believed its reception essential to the salvation of his hearers. In 1795 he published his *Wissenschaftslehre* (Doctrine of Science), in which he clearly broke away from Kant, whose speculations did not seem to him sufficiently thorough, or, as Eng-

lishmen would say, *idealistic*. Indeed, as early as 1793, writing to Niethammer, he says: "My conviction is, that Kant has only *indicated* the truth, but neither unfolded nor proved it." An accusation of atheism, which F. fervidly but fruitlessly refuted, cost him his chair in 1709. In the previous year, he published his *System der Sittenlehre* (System of Ethics, Jena, 1798), considered by many to be his most mature work. He now removed to Berlin, where he delivered lectures on philosophy to a select auditory. In 1800, appeared his *Ueber die Bestimmung des Menschen* (On the Destiny of Man). In 1805, he obtained the chair of philosophy at Erlangen, with the privilege of residing at Berlin in the winter. Here he delivered his celebrated lectures *Ueber das Wesen des Gelehrten* (On the Nature of the Scholar, Berlin, 1805–1806). In the same year appeared his *Grundzüge des gegenwärtigen Zeitalters* (Characteristics of the Present Age); and in 1806, his *Anweisung zum seligen Leben oder die Religionslehre* (The Way to the Blessed Life, or the Doctrine of Religion). But F. was a patriot as well as a philosopher. The victories of Napoleon at Auerstadt and Jena drew forth the famous *Reden an die Deutschen* (Addresses to the Germans). These addresses were full of the most exalted enthusiasm. F. "laments that his age has denied him the privilege accorded to Æschylus and Cervantes, to make good his words by manly deeds." The Prussian king appreciated the zeal of the eloquent metaphysician, and, on the restoration of peace, requested him to draw up a new constitution for the Berlin university. In 1810, the university was opened, with a host of brilliant names, F., Wolff, Müller, Humboldt, De Wette, Schleiermacher, Neander, Klaproth, and Savigny. By the votes of his colleagues, F. was unanimously elected rector. Here, as at Jena, he labored with unremitting energy for the suppression of all those customs which he deemed barbarous in themselves, and incompatible with the true idea of a scholar. In 1813, the war of independence broke out, and the hospitals of the Prussian capital were soon crowded with patients. F.'s wife was one of the first who offered her services as a nurse. For five months, she tended the sick with all the patient tenderness and devotion of her nature. At last, she was seized with fever, 3d Jan., 1814. After a fearful struggle, she recovered; but her husband caught the infection, and in spite of all remedies, sank under its influence, and died 27th Jan., 1814. It is difficult to speak calmly of Fichte. His life stirs one like a trumpet. He combines the penetration of a philosopher with the fire of a prophet, and the thunder of an orator; and ove all his life lies the beauty of a stainless purity. See *Fichte's Leben und literarischer Briefwechsel* (published by I. H. Fichte, 2 vols. Sulzb. 1830–31); and W. Smith's *Memoir*, published by Chapman and Hall (Lond. 1848). The fundamental notion of the idealism set forth in F.'s writings, at least in the earlier of them, is the sole reality of the *Ego* or I, which posits both itself and the *Non-ego*, or not-I. (The phrase "to posit," it ought to be observed here, signifies in German metaphysics, to present to the consciousness. Hence, when it is said that the *ego* posits itself, the meaning is, that the ego becomes a fact of consciousness, which it can only become through the antithesis of the *non-ego*.) Under this ego, however, must not be understood, according to the usual misapprehension, the human and finite, but the "absolute subject-objectivity" (*absolute subject objectivität*) the eternal, universal reason. The ego is the absolutely productive, which, however, would not attain to consciousness of itself—i.e., of its infinite spontaneous activity, did it not at the same time place in contrast to itself, and as an impediment (*anstoss*) and limit to its activity, the non-ego—i.e., the objective world, or nature. The ego, in so far as it is determined by the non-ego, is the intelligent ego, and, as such, the subject of theoretical science; the ego, on the other hand, as determining the non-ego, is the subject of practical science. Freedom, absolute, spontaneous activity, for its own sake, is not with F., as with Kant, the condition and pre-supposition of moral action, but is itself the highest expression of the problem of the moral law. To realize this self-activity, however, the ego requires an external world of objects, in order that in them as limits it may become conscious of its own activity. To this idealistic system of ethics it has been plausibly—some think unanswerably—objected that it makes the non-ego be required as the condition of morality, and at the same time represents the removal of this condition as the aim of moral effort. With respect to the idea of right, F.'s theory of freedom, in its fundamental principles, attached itself to the Kantian theory of freedom as the innate and primitive principle of right. Generally speaking, F. makes that which, from the stand-point of ordinary consciousness, we call the world, merely a product of the ego; it exists only through the ego, for the ego, and in the ego. F. himself afterwards modified or extended his system, so as to bring out more prominently the *theistic* character of his metaphysics. The transition to this later stage of F.'s philosophy is seen in his *Bestimmung des Menschen* (Destination of Man). It arose from the intense religiosity of his nature. F. was essentially a worshiping nature, and though he never ceased to be a philosopher, the untiring aspiration of his later years was to realize in his own way the belief of the great Jewish lawgiver: "The eternal God is thy refuge, and round thee are the everlasting arms." A popular exposition of his philosophy is given in his *Anweisung zum seligen Leben*. It is set forth in a strictly scientific manner in the lectures published in the *Nachgelassene Werke*, edited by I. G. Fichte (3 vols. Bonn, 1834–35), in which his *Speculative Logik* and his revised theory of right and morals are particularly deserving of attention. Although F. never, strictly speaking, formed a school, and though his system has only been adopted by a few, such as J. B. Shad, Mehmel,

Cramer, Schmidt, and Michaelis, his influence upon the subsequent development of German philosophy has been very important. F.'s collective works have likewise been published by his son, I. H. Fichte. His popular works have been translated into English by W. Smith, and published by J. Chapman of London in his "Catholic Series." Their titles are: *The Destination of Man; The Vocation of the Scholar; The Nature of the Scholar; The Way to the Blessed Life;* and *The Characteristics of the Present Age.*

FICHTELGEBIRGE, a mountain group of Bavaria forming the center from which three extensive mountain ranges proceed. The highest points are 3,490 and 3,340 feet. There is abundance of wood, as well as of iron, sulphur, vitriol, lead, copper, and many kinds of marble. The people are chiefly employed in mining and smelting. Objects of interest in the region are the celebrated watering-place of Alexandersbad, and the sandstone labyrinth of Luisenburg.

FICI'NO, MARSILIO, an illustrious philosopher of the Italian platonic school, was b. at Florence 1433. He was the son of the principal physician of Cosmo de' Medici; and to the liberality of this prince he owed the classical culture which inspired his future career. At the suggestion of Cosmo, F. undertook the translation of Plotinus, Iamblichus, Proclus, and Porphyry, besides a Latin but by no means literal version of Plato. In 1463, he was appointed by Cosmo president of a classical society or academy, founded in 1440, having for its aim the diffusion of the Platonic doctrines, which F. held to be the basis and confirmation of the Christian system. On the death of Cosmo, F. found a no less munificent patron in this prince's grandson, Lorenzo de' Medici; and having, at the mature age of 40, decided on entering the church, he was endowed by Lorenzo with the rectorship of two churches in Florence, and a canonry in the cathedral His theological doctrine, while undoubtedly sincere, presents a strange medley of incongruous views, the natural result of his attempt to fuse the philosophy of Plato with the Christian creed. He died in 1499, and was interred in the cathedral of Florence, where a monument commemorates his upright and manly qualities no less than his learning and philosophy, F.'s collected works were published at Basel (2 vols. f., 1491), and consist of translations from the Greek philosophers, and original metaphysical and theological compositions, of which we may mention the *Theologica Platonica, De Religione Christiana,* the Latin epistles, and a Commentary on the Epistles of St. Paul.

FICTION. See NOVELS.

FICTION OF LAW has been defined to be "a supposition of law that a thing is true, which is either certainly not true, or at least is as probably false as true."—Erskine, *Inst.* iv. 2, 38. Fictions have existed in all legal systems. They must be regarded as a species of legal fraud, which has been tolerated as enabling individuals who, by the strict letter of the law, would have been excluded from obtaining redress of evils, to procure that remedy by a pious fraud. There are two general maxims which regulate the application of fictions—viz., that no fiction shall be allowed to operate a wrong, and that no fiction shall be admitted which in the nature of things is impossible. The Roman form of judicial procedure abounded with fictions, by which alone, in many cases, a party aggrieved could enforce his right. Thus, an heir, unjustly disinherited, by the *querela inofficiosi testamenti,* feigned that his father had been mad. A stranger in Rome, who had been robbed, could not obtain restitution without the *fictio civitatis,* whereby he feigned himself a citizen. Many of the fictions existing in Rome have found a counterpart in modern systems; thus, the *fictio longæ manus,* whereby lands at a distance were feigned to be delivered, resembles an English feoffment at law. In like manner, the *fictio traditionis symbolicæ* of keys of a warehouse to give possession of the articles contained therein, and of a deed in confirmation of the covenants contained therein. The *fictio unitatis personarum* was the original of the Scottish fiction, that the heir is *eadem persona cum defuncto.* But in no system of law have fictions been so liberally adopted as in that of England. It is by means of fictions alone that the original limited jurisdiction of the courts of Queen's bench and exchequer has been extended to ordinary suits. In the latter court, every plaintiff assumed that he was a debtor to the crown, and was debarred from discharging his obligation by the failure of the defendant to satisfy his demand; in the former, it was assumed that the defendant had been arrested for some supposed trespass which he had never in fact committed. The fictitious character of John Doe and Richard Roe long contributed to make the action of ejectment famous. And though these fictions have disappeared before the ruthless hand of modern legislation, yet to this day, in an action at the instance of a father for the seduction of his daughter, damages can only be awarded on the assumption that she was his servant, and that he has suffered pecuniary loss by deprivation of her services. In chancery, again, the whole doctrine of uses and trusts is based upon a fiction. Perhaps the best explanation of the introduction of fictions into legal systems is to be found in Dr. Colquhoun's *Summary of the Roman Civil Law,* 2027. It involves, he says, "less difficulty to adhere to known and admitted forms, and gradually to accommodate them to the changed state of society, than to upset all the incidents connected with them by a sudden change, which must ever tend to unsettle the law and practice of the courts. All nations have therefore found it more desirable to let the one glide into the other, than to adopt any abrupt measure which might disturb the practice and effect of former decisions."

In the law of Scotland, fictions of law are not of frequent occurrence. For the benefit of creditors, the principle that the heir is *eadem persona cum defuncto* is admitted; and in an action of "reduction-improbation" of a deed, it is assumed that the document was false, whether the fact be so or not. But in general the legal system of Scotland has shown a facility of adapting itself to the circumstances of the case, and that without producing the alarming results which presented themselves to the imagination of Dr. Colquhoun.

FICUS. See FIG.

FID (from the Lat. *findere, fidi*, to divide), for splicing ropes, is a large pointed pin, with an eye at the thick end, of iron or lignum vitæ, used by sailors in separating and interlacing the strands of which the rope is composed.

A *mast-fid* is a bolt inserted through the bottom of a ship's topmast or top-gallant-mast, with ends resting on the trestle-trees sustained by the head of the lower mast or topmast. Unless the mast-fid be withdrawn, the supported mast cannot be lowered.

FIDDEMIN, one of the handsomest villages of the Fayûm, inhabited by a Mussulman and Coptic population. It is surrounded by fruit-trees, and is remarkable for a large olive, supposed to be the original one planted in Egypt, and yielding annually 268 lbs. of olives.—Clot Bey, *Aperçu générale sur l'Egypte* (8vo, Paris, 1840), vol. i. p. 213.

FIDDLE. See VIOLIN.

FIDEICOMMISSUM, in the civil law, was a conveyance of property in trust to be transferred to a third person named by the truster. *Fideicommissa*, when first introduced, were not supported by the law. The performance of them depended, therefore, on the conscience of the party intrusted, and they were consequently frequently not carried out. They were originally adopted for the purpose of conveying property either where a party, from the circumstances of the case, as inability to procure the proper number of witnesses, was prevented from executing a will; or where he desired to benefit those who, by law, were precluded from taking the property. To effect this purpose, an actual conveyance was made to a friend, coupled with a request that the property should be transferred to another. Fideicommissa having thus been introduced for a special purpose, were by degrees extended to conveyances of the whole inheritance, and finally were used for the purpose of settling estates in a particular order of succession, forming the earliest instance of entails (q.v.). Fideicommissa first received the sanction of positive law in the reign of Augustus, by whom authority was given to the prætor to enforce the performance of these fiduciary obligations.—*Institutes*, ii. 23, s. 1. The emperor Claudius subsequently extended this authority to the consuls and presidents of provinces. Fideicommissa were either *particular* or *universal*, the former being a bequest of a particular subject, or a part only of the inheritance; the latter comprehended the whole estate

In *Holland*, the principles of the civil law as to fideicommissa form an important branch of the law in regard to landed estates. An heir may be required to transfer either the whole or a portion of his inheritance. The provisions of the senatus-consultum trebellianum also have been adopted; but if an heir resist the intentions of the testator, and is compelled by law to execute the trust, he is not allowed to take the benefit of these provisions. The benefit also may be excluded by express direction in the will. Children who have received their legal portions, and are required to transfer to a stranger the rest of the inheritance, are entitled to retain a fourth part for themselves. Grotius, *Dutch Jurisprudence*, by Herbert, b. ii. c. 20.

FIDI'CULA, a small musical instrument in the shape of a lyre.

FIEF. See FEUDAL SYSTEM.

FIELD. In heraldry, the field is the whole surface or continent of the escutcheon or shield. It is so called, according to some, because it represents the field of battle on which the achievements or charges represented on it are supposed to have been gained. In blazoning, the tincture or metal of the field must be the first thing mentioned.

FIELD, CYRUS WEST, an American merchant, one of a family distinguished for ability, was b. at Stockbridge, Mass., Nov. 30, 1819. At the age of 15, he went to New York, and entered upon a commercial career, which he pursued with such energy and success that he was enabled, in 1853, to partly retire from business, to spend some time in South American travel, and then to engage with great enthusiasm in the promotion of the Atlantic telegraph, for which he secured a charter from the colonial government of Newfoundland for 50 years. Being joined by Peter Cooper, Moses Taylor, and other American capitalists, he organized, in 1854, the New York, Newfoundland, and London telegraphic company; and in 1856, the Atlantic telegraph company. Devoting himself entirely to the work of uniting the old and new worlds, he crossed the ocean nearly 30 times in its prosecution; and on the laying of the first cable, 1858, was received by his countrymen with enthusiastic plaudits. He continued his exertions; and on the success of the cable of 1865, received a gold medal at Liverpool, and a vote of thanks from the American congress. In 1871, F. was one of the originators of the company which undertook to lay a cable across the Pacific ocean *viâ* the Sandwich islands to China and Japan. See ATLANTIC TELEGRAPH.

FIELD, CYRUS WEST (*ante*), b. Stockbridge, Mass., 1819; brother of David Dudley. He left his home at the age of 15 to enter a mercantile house in New York, and a few years later was the head of a prosperous concern. Retiring from business in 1853, he traveled for seven months in South America with Mr. Frederic E. Church, the artist, and on his return was applied to for aid in building a telegraph line in Newfoundland —an undertaking which had been begun, but had proved a total failure. The plan was to carry the line across that island to St. John's, the furthest point on the American coast, and there connect with a line of fast steamers, which, it was thought, could reach the nearest point in Ireland in five days. Thus America could be brought easily within a week of Europe. While Mr. Field was considering this proposal, and turning over the globe in his library, the thought flashed upon him, "Why not carry the line across the ocean?" In this was the germ of that project of an Atlantic telegraph to which he was to devote the next 13 years of his life. Having obtained, in 1854, from the legislature of Newfoundland, the exclusive right for 50 years of landing telegraph cables from Europe and America on the island, he formed a company known as the "New York, Newfoundland, and London Telegraph Company." In 1856, he went to London and organized the "Atlantic Telegraph Company." Mr. Field furnished one fourth of the capital, and the United States and British governments provided ships for the undertaking. The expeditions of 1857, the two of 1858, and those of 1865 and 1866 were mainly due to his efforts of organization, for although the first two were failures, and the cable laid by the third worked but four weeks, he never lost faith in the enterprise. In 1866, however, a cable was finally laid, and the cable of 1865 was picked up in mid-ocean by the Great Eastern, joined to the cable on board, and the western terminus was safely landed.

The success was complete, and in both countries honors were showered upon the leaders of the expedition. In England several were knighted, and others made baronets; and the prime minister, in conferring these rewards, said that the only reason why Mr. Field was not included in them was that it was felt that any title or dignity might not be acceptable to an American citizen. But he had honors enough at home. Besides innumerable congratulations, he received the unanimous thanks of congress, with a gold medal, and other testimonials for what was recognized as one of the most remarkable achievements of the century. The French exposition of 1867 awarded him the grand medal, its highest award, given only to those who were recognized as great public benefactors.

Since then, while enjoying the fruits of his chief work, he has not been idle in other directions. He has taken interest in the different submarine cables in the Mediterranean and in the east. Within the last three years he has devoted much of his thought and of his capital to the establishment in New York of the system of elevated railroads, which have supplied a want long felt, and proved an inestimable blessing to the city. He has still one more dream of his life, to lay a telegraphic cable across the Pacific, and thus complete the circuit of the globe. See ATLANTIC TELEGRAPH.

FIELD, DAVID DUDLEY, D.D., 1781–1867; born in East Guilford, now Madison, Conn.; graduated from Yale college in 1802; studied for the Congregational ministry, and in 1804 was settled at Haddam, on the Connecticut river; in 1818, was called to Stockbridge, Mass.; in 1837, he was recalled to his old parish in Connecticut, where he spent the last fourteen years of his active ministry. In 1851, having reached the age of seventy, he returned once more to Stockbridge, and there passed the evening of his life, greatly respected as one of the most venerable ministers of New England. He was the author of several local histories, such as that of Middlesex co., Conn., and of the city of Middletown; of Berkshire co., Mass., and of the town of Pittsfield; and of a genealogy of the Brainerd family. He also published a number of sermons.

FIELD, DAVID DUDLEY, b. Haddam, Conn., 1805; an eminent lawyer; son of David Dudley, D.D. He graduated at Williams college in 1825, studied law, and was admitted to the bar in 1828. He commenced practice in New York, where he has been a conspicuous figure at the bar for more than fifty years. Besides a very large professional practice, he devoted all the time which he could spare from pressing engagements for forty years to the reform of the law. He began the movement by writing articles in reviews and papers and pamphlets, showing the urgent necessity of reconstructing the modes of legal procedure. Having been appointed in 1847 a commissioner on practice and pleadings by the legislature of New York, he devoted himself first to the preparation of a code of civil procedure. The design of the new system of civil procedure was to wipe out the distinction between the forms of action, and between legal and equitable remedies, in order that all the rights of the parties in relation to the subjects of litigation could be decided in a single action, instead of dividing them, as formerly, between different suits. This system has been adopted in 24 states and territories, and has been substantially followed by Great Britain and many of her dependencies. The same commission framed a code of criminal procedure, which has been adopted by 15 states and territories. In 1837, Mr. Field was placed at the head of a new commission to prepare a political code, a penal code, and a civil code, which were finished and reported, but have not been adopted by the state of New York, though the civil and penal codes were passed by the two houses, almost unanimously, in 1879, and failed only for want of the governor's

signature.]» They have been of great service, however, in the legislation of other states, especially in California, where they were adopted with a few alterations that were necessary in order to adapt them to the condition of that state. In 1866, the British association for the promotion of social science held a meeting at Manchester, at which Mr. Field made a proposal for a general revision and reform of the law of nations, similar to that aimed at in his labors for the reform of the civil and criminal law. Acting on his proposal, he completed, in 1873, a work entitled *Outlines of an International Code*, which he presented to the social science congress of that year. It met with very favorable criticism from eminent jurists all over the world.

In 1873, he was elected first president of an association for the reform and codification of the law of nations, formed at Brussels in that year. This association has for one of its great objects the substitution of arbitration for war in the settlement of disputes between nations.

FIELD, HENRY MARTYN, D.D., b. Stockbridge, Mass., 1822; brother of David Dudley. After graduating from Williams college, he studied theology, and was ordained pastor of a Presbyterian church in St. Louis in 1842. He resigned this position in 1847 to go abroad, and spent a year in Europe. 1848 was the year of revolutions. He was in Paris during the three days of Feb. when Louis Philippe was overthrown, and wrote a very full description of the scenes of which he was an eye-witness. On his return he published also a sketch of the Italian revolutions, and a letter from Rome on *The Good and the Bad in the Roman Catholic Church*. At this time he wrote *The Irish Confederates: a History of the Rebellion of* 1798. In 1851, he was settled as pastor of a Congregational church in West Springfield, Mass., and in 1854 removed to New York, to become one of the editors of *The Evangelist*, a well-known religious journal, of which he is now sole proprietor. After making a second tour in Europe in 1858, he published *Summer Pictures: from Copenhagen to Venice;* and in 1866, he issued *The History of the Atlantic Telegraph*. In 1867, he was a delegate to the Free church of Scotland and the Presbyterian church of Ireland, and visited the great French exposition. In 1875–76, he spent a year and a quarter in a tour around the world, which furnished the material for two volumes, *From the Lakes of Killarney to the Golden Horn*, and *From Egypt to Japan*, which have had a remarkable popularity.

FIELD, JOHN, 1782–1837; an English pianist and musical composer, a pupil of Clementi, whom he accompanied on a concert tour through Europe. In Russia, after separating from Clementi, he was remarkably successful, but his extravagance kept him always poor. An unhappy marriage with a French lady was speedily dissolved. He was not a prolific writer, but he left many works not easily forgotten. His nocturnes need no other claim to immortality than the fact of their being the inspiration on which Chopin worked.

FIELD, JOSEPH M., d. 1856; an actor and dramatist, b. England, but for many years a resident of New Orleans, where he produced a number of plays. He was widely known as "Straws," a humorous writer on the *New Orleans Picayune*, and later as an editor in St. Louis. He was the father of Kate Field, the actress and lecturer of the present day. He published *The Drama in Pokerville*.

FIELD, KATE, b. St. Louis, daughter of Joseph M. She was educated in Massachusetts and in England, and at an early age became known as a correspondent for American newspapers and a writer for magazines. In 1874, she appeared on the stage in New York as "Peg Woffington," but with indifferent success. She was more successful as a lecturer. Recently she has passed most of her time abroad, where she has been received with much honor; but in 1880 is endeavoring to establish in New York a co-operative system for ladies in the purchase of dress goods. She is a facile and interesting writer.

FIELD, STEPHEN JOHNSON, b. Haddam, Conn., 1816; brother of David Dudley. At the age of 13 he made a voyage to the east in company with a brother-in-law, who was a missionary, and he spent three years in Smyrna and Athens, studying Greek and other languages. Returning to this country, he graduated at Williams college, in 1837, with the highest honors. He then studied law in the office of his brother in New York, and, after his admission to the bar, became his partner until 1848, when he went abroad and passed a year in Europe. On his return, in 1849, he joined in the emigration then just beginning to California, settled at a place where now stands the city of Marysville, and was elected the first alcalde, holding the office until the organization of the judiciary under the constitution of the state. Under Mexican law an alcalde had a very limited jurisdiction; but after the American occupation the jurisdiction exercised by him in the anomalous condition of society in California at that time was practically unlimited. In 1850, he was elected to the legislature, and was placed on the judiciary committee. He drew up a bill defining the powers of the courts of justice and judicial officers of the state, which was passed, and most of its provisions are still retained in the code. He secured also the passage of a law giving effect to the usages and regulations adopted by the miners for the protection and working of the mines. The principle embodied in this law was adopted in other mining regions of the country, and finally by the congress of the United States. In 1857, he was elected

judge of the supreme court of California, and in 1859 he succeeded David S. Terry as chief-justice. When Mr. Field came to the bench, the titles to lands in the state were unsettled, and it is principally by decisions in which he delivered the opinions of the court that the law of real property in California has been placed on a permanent basis. He was appointed in 1863, by president Lincoln, an associate justice of the supreme court of the United States, which position he still holds. The opinions of the court in the celebrated test-oath cases, written by him, and his dissenting opinion in the legal-tender cases, attracted general attention. In 1869, he was appointed professor of law in the university of California; in 1873, as one of a commission to examine the codes of the state, he prepared amendments which were adopted by the legislature. He was a member of the famous electoral commission of 1876 which decided the presidency in favor of Rutherford B. Hayes; and voted with the minority in favor of Samuel J. Tilden. His recent opinions in the Virginia jury cases, and the cases arising under the election laws of congress, have been the subject of much discussion throughout the country.

FIELD-ALLOWANCE, a daily allowance granted to officers of the British army in consideration of extra expense entailed upon them in consequence of military operations. *Ordinary* field-allowance, ranging from £1 10*s.* for a general officer to 1*s.* for a subaltern, is applicable when troops are encamped at home or in the colonies. *Extraordinary* field-allowance is sanctioned when and wherever troops are engaged in actual warfare: it ranges for the above ranks from £2 10*s.* to 1*s.* 6*d.* Strict rules are laid down that no officer shall receive this allowance unless positively present with the army.

FIELD OF THE CLOTH OF GOLD, a plain near Guisnes, in the department of Calais, France, where Henry VIII. of England and Francis I. of France held a conference in June, 1520. The throne of France was sought for by Charles I. of Spain (afterwards Charles V.), and Francis sought the friendship of the English king. To bring about such a result Francis proposed to raise cardinal Wolsey to the papacy. Wolsey brought about and conducted the meeting, which was attended with so much splendor of pageantry as to give the peculiar title to the place. In the opening of *Henry VIII.* Shakespeare gives the following vivid description of the event:

Buckingham. An untimely ague
Stay'd me a prisoner in my chamber when
Those sons of glory, those two lights of men,
Met in the vale of Andren.
Norfolk. 'Twixt Guynes and Arde:
I was then present, saw them salute on horseback;
Beheld them, when they lighted, how they clung
In their embracement, as they grew together;
Which had they, what four throned ones could have weigh'd
Such a compounded one?
Buckingham. All the whole time
I was my chamber's prisoner.
Norfolk. Then you lost
The view of earthly glory: men might say,
Till this time pomp was single, but now married
To one above itself. Each following day
Became the next day's master, till the last
Made former wonders its. To-day the French,
All clinquant, all in gold, like heathen gods,
Shone down the English; and, to-morrow, they
Made Britain India: every man that stood
Show'd like a mine. Their dwarfish pages were
As cherubims, all gilt: the madams too,
Not used to toil, did almost sweat to bear
The pride upon them, that their very labor
Was to them as a painting: now this masque
Was cried incomparable; and the ensuing night
Made it a fool and beggar. The two kings,
Equal in lustre, were now best, now worst,
As presence did present them; him in eye,
Still him in praise: and, being present both,
'Twas said they saw but one; and no discerner
Durst wag his tongue in censure. When these suns—
For so they phrase 'em—by their heralds challenged
The noble spirits to arms, they did perform
Beyond thought's compass; that former fabulous story,
Being now seen possible enough, got credit,
That Bevis was believed
Buckingham. O, you go far.
Norfolk. As I belong to worship and affect
In honour honesty, the tract of everything
Would by a good discourser lose some life,
Which action's self was tongue to. All was royal;
To the disposing of it nought rebell'd,
Order gave each thing view; the office did
Distinctly his full function.

The solemnities occupied nearly three weeks. Ten days were spent in the feats of arms for which Wolsey had provided. There were tilting with lances, and tourneys on horseback with the broadsword, and fighting on foot at the barriers. The kings were always victorious against all comers. On midsummer day the gaudy shows were over.

FIELDFARE, *Turdus pilaris,* a species of thrush (q.v.), in size about equal to the blackbird, but with greater length of wing; the general color gray, the feathers tipped with a brownish black elongated spot; the throat and breast reddish yellow, streaked and spotted with black; the forepart of the back and wings of a rich brown color; the tail slightly forked and nearly black; the under parts white. The F. is a very common winter visitant of Britain, although it rarely breeds even in the northern parts of the island. It arrives from more northern regions when the winter has fully come, and departs again towards the end of spring. It is well known to youthful sportsmen, and affords much employment for their guns during the Christmas holidays, when it may generally be found in small flocks—often along with its smaller congener, the redwing—in fields, if the weather is mild, feeding on worms, snails, etc., or, in severe weather, about hedges, thickets, and woods, wherever haws and other such fruits or seeds are abundant. Its winter migrations extend southward as far at least as the islands of the Mediterranean. It is one of the summer songsters of the n. of Europe and of Siberia; its song is soft and melodious, but is much less familiar to us in Britain than its call-note, which is harsh. It is extremely plentiful in Norway, where its nests are very generally built in spruce firs, and, contrary to the ordinary habits of thrushes, in society; numerous nests being often to be found in the same tree, and "two hundred nests or more being frequently seen within a very small space." The F. is easily tamed, and sings well in captivity.

FIELD-GLASS is the lens usually interposed between the object-glass and eye-glass of a microscope, which, receiving the diverging rays from the former before they form an image, contracts the dimensions of the image, and increases its brightness, so as to render it of a proper size and degree of distinctness for being viewed by means of the eye-glass. See FIELD OF VIEW, and MICROSCOPE.

FIELDING, COPLEY VANDYKE, an English painter in water-colors, was b. about 1787, and began to exhibit in 1810. For many years he held the office of president of the society of painters in water-colors, and was generally recognized as the representative of that branch of art in England. He died at Worthing, in Sussex, Mar. 3, 1855, in his 68th year, and after a career of steady prosperity. Possessing remarkable mechanical dexterity and knowledge of effect, F. painted with what severe critics would call fatal facility. He contributed about a score of pictures annually to the exhibition of the water-color society. But, to do him justice, he always exhibited a certain easy finish of treatment, which was perhaps of itself a kind of secondary talent. Although his range of subjects was but limited, yet within it he was almost unrivalled. As a painter of marine effects, and of the landscapes of down and glade, it is thought by many that he has had as yet no equal.

FIELDING, HENRY, b. April 22, 1707, was the son of gen. Edmund Fielding, connected with the earls of Denbigh. He was sent to Eton, and was afterwards transferred to the university of Leyden, to prosecute legal studies. Returning to London, he began to write for the stage, and worked with so much industry that between 1727 and 1736, he produced nearly a score of comedies and farces, which were forgotten with nearly as much speed as they were produced. He married in 1736, and falling heir to a small estate, he, with his young wife, retired from London. But his was not a Fortunatus's purse, and his hand was continually in it; and in three years after his marriage, he was back in London a student at the temple. He was called to the bar at the usual time, but gout intervening, steady practice was rendered impossible. Happily, a way of escape was at hand. Richardson published *Pamela;* the town was ringing with it; and F., whose strong, healthy, unconventional nature revolted from the moral priggishness of "Virtue Rewarded," resolved to write a counterpart, purporting to be the adventures of Pamela's brother, *Joseph Andrews.* This work, begun in a satirical mood, and intended merely to quiz Richardson, deepened as it proceeded, and flowered out into humorous adventure. The exquisite character of parson Adams took the world by surprise, and remains one of the permanent glories of English fiction. The next important work undertaken by him was *Jonathan Wild,* a masterpiece of irony, which has never been sufficiently appreciated, and which doubtless suggested to Mr. Thackeray the scope and conduct of *Barry Lyndon.* The rebellion of 1745 induced F. to undertake the direction of the *Jacobite Journal,* in support of the Hanoverian succession; and shortly after, as a reward for his loyalty, he was, through the influence of lord Lyttelton, promoted to a pension, and to the place of justice of the peace of Middlesex and Westminster. While engaged in magisterial duties, he produced *Tom Jones,* his most famous fiction, which the world has never ceased to read, nor critics to admire. His next work was *Amelia*—less striking and masterly than its predecessor, but quieter in style, and enriched with scenes of domestic tenderness. Shortly after its publication, he was attacked by dropsy, jaundice, and asthma, a complication of disorders which baffled the skill of the physicians. Seeking relief, he left England for Lisbon on the 26th June, 1754, and died there on the 8th Oct. of the same year, at the early age of forty-seven.

F. was the first great English novelist, and he remains to this day one of the greatest. *Tom Jones* is a miracle of invention, character, and wit. It contains the most amusing scenes and adventures, the most sparkling delineations of life, high and low, the most

abundant satire. Everywhere, the author's manliness, shrewd sense, and scorn of meanness and hypocrisy, are apparent. If defects may be hinted, it may be said that F.'s nature was more robust than delicate; that it was deficient in the sentimental and poetic side; and, as a consequence, that his ideal of woman is not high, and his descriptions of the tender passion either commonplace or extravagantly rapturous. The love-scenes between Tom and Sophia, and the episode of the "Man of the Hill," which is meant to be passionate and poetic, are perhaps the only portions of the great novel which readers skip. It is to be regretted that all F.'s works are disfigured by coarseness of circumstance and expression; but that was the fault of the time as much as of the man. He was coarse, as he wore ruffles, drank claret, and hated the pretender. He set himself to paint society as he saw it, and we must forgive the coarseness for the truthfulness of the picture.

FIELD-MARSHAL, the highest rank of general officers in the British and some foreign armies. In the former, it is a special honor enjoyed by very few officers, and only conferred by selection, either on the ground of distinguished service or of royal birth. When unemployed, the field-marshal has no higher pay than any other gen., but if commanding an army, he receives £16 8*s.* 9*d.* a day for staff-pay, while a gen. has but £9 9*s.* 6*d.* The equivalent rank in the navy is that of admiral of the fleet. Formerly, a capt.gen. was occasionally appointed, who had rank higher even than a field-marshal.

FIELD-MOUSE, a name popularly given to certain species both of MOUSE and of VOLE. See these articles.

FIELD-OFFICERS, in the army, are such as are competent to command whole battalions—viz., majs., lieut.cols., cols.—in contradistinction to those merely intrusted with company duties, as capts., lieuts., and sublieuts.

FIELDS, JAMES THOMAS, b. N. H., 1817; educated in a high school in Portsmouth, and became a clerk in a book-store in Boston. In his 18th year, he read the anniversary poem before the Boston mercantile library association, on which occasion Edward Everett delivered the oration. In 1848, before the same society, he delivered another poem, *The Post of Honor*, Daniel Webster being the orator. He is widely known as a member of the successive publishing houses of Ticknor, Reed, and Fields; Ticknor and Fields; and Fields, Osgood, and Co.; for 25 years, to 1871. He collected and issued De Quincey's works in 21 volumes. In 1849, 1854, and 1858, respectively, he printed volumes of his poems for private distribution. He edited *The Atlantic Monthly* from 1862 to July, 1870; has repeatedly visited Europe, and has had wide acquaintance with literary men abroad. He has also lectured in the United States, and published *Yesterdays with Authors*, in which are many anecdotes of literary men.

FIELD-TRAIN, a department of the royal artillery, consisting of commissaries and conductors of stores, responsible for the safe custody of the ammunition, for the formation of proper depots of shot, etc., between the front and the base of operations, and that a due proportion shall be constantly at the service of each gun during an engagement.

FIELD OF VIEW is the whole space within which objects can be seen through an optical instrument; more strictly, it is the space within which the image of an object may be seen by whole pencils. That part of the image which is seen by partial pencils of the light from the object speculum or lens is called the *ragged edge*, and usually a diaphragm is employed to cut it off from the view of the observer altogether.

FIELD-WORKS are intrenchments and other temporary fortifications thrown up by an army in the field, either as a protection from the onslaught of a hostile force, or to cover an attack upon some stronghold. Field-works will be more particularly described under the article fortifications (q.v.).

FIERDING COURT (Fierding Thing), a district court in use among the early Gothic nations. This court was established for the purpose of rendering speedy justice in small matters. There were four of these courts in every hundred, each presided over by a separate judge, whose jurisdiction extended to all causes where the matter in dispute did not exceed the sum of three marks. Stiernhook, *De Jure Goth.*, lib. i. c. 2.

FI'ERI FA'CIAS, WRIT OF, an English writ for enforcing the judgment of a court of law against the goods of a debtor. It may be sued out as soon as final judgment has been signed, or, in case of a trial out of term, in fourteen days after verdict, unless, on special cause shown, a judge order speedy execution. But a writ of F. F. cannot be enforced after a *capias ad satisfaciendum* (q.v.) has been issued. The sheriff, in executing this writ, may not break open doors; but having obtained peaceable entrance, he may break open inner doors, cupboards, and trunks. The officer in execution having taken possession, may leave an assistant in charge, by whom an inventory of the goods is made. He is entitled to remain on the premises a reasonable time in order to remove the goods; but if he continue longer without permission of the owner, he is liable to an action for trespass. By 8 Anne, c. 14, if goods are removed from land or premises let on lease, the party removing them must pay the rent and taxes. A creditor may not take, in execution, manure, hay, etc., where, by the covenants of the lease, the tenant

is prohibited from removing them (56 Geo. III. c. 50). Growing crops, if seized in execution, and sold, are liable for rent accruing after the date of the seizure, as long as they remain on the ground (14 and 15 Vict. c. 25). By 1 and 2 Vict. c. 110, money, bank notes, bills of exchange, and other securities, may be taken under a writ of fieri facias. By 8 and 9 Vict. c. 127, a creditor is not entitled to take wearing-apparel and bedding or tools where the value of the whole does not exceed £5. Such fixtures as belong to the heir, and not to the executor, cannot be taken under this writ. The goods of the party only who is named in the writ may be seized; and if the officer take goods belonging to a stranger, he is liable to an action for damages. By 1 and 2 Vict. c. 110, decrees in chancery have the effect of a judgment in a court of law. In Scotland, the corresponding process for seizing and selling a debtor's goods is a warrant to poind the movables. See POINDING.

Fieri facias de bonis ecclesiasticis is a writ directed to the bishop of the diocese, requiring him to attach the ecclesiastical goods of a clergyman within his diocese, in satisfaction of the judgment of a court of law.

FIES'CHI, Count GIOVANNI LUIGI, a member of one of the most illustrious houses of Genoa, was b. about the year 1523. In addition to the luster of ancestral fame, his name has attained a tragic historical celebrity in connection with a remarkable conspiracy of which he was the chief. Andrea Doria, a famous admiral, sprung from a race hereditarily at feud with that of F., having expelled the forces of Francis I. from the state, had restored the republican form of government, but at the same time, by his vigorous administration, effectually held in check the ambition of the nobles. Count F. organized a plot, having for its object the death of Doria, and his nephew Gianettino, the object of F.'s special hatred, and the establishment of an oligarchic form of government. Instigated by the approval of France and Rome, and supported by an alliance with the duke of Parma, F. speedily enrolled a formidable array of accomplices, his three brothers among the foremost. Crowds of his own feudal retainers were secretly armed and assembled from the various hereditary lands of the house; three galleys, purchased with the connivance of the pope, were fully equipped; and all being in readiness, the attempt was fixed for the 2d of Jan., 1547. Doria, in spite of repeated warnings, refused to ascribe treacherous or subversive designs to F., whom he regarded as a fast friend and partisan. Complete success seemed at first to crown the conspirators; the gates of the city were forced, the fleet captured, Gianettino assassinated, Doria in flight. F. had but to appear and dictate, but he was nowhere to be found; and the strangest episode of this wild drama is the sudden disappearance of its hero. In stepping from one galley to the other in the darkness of night, F. stumbled, and falling overboard, was borne down by his ponderous armor, and miserably drowned in the harbor, or, according to some, stifled in the slime.

FIESCHI, JOSEPH MARCO, known by his attempt on the life of king Louis Philippe, was b. in Corsica in the year 1790. His early life contains nothing of note. A profligate career appears to have reduced him to great poverty about the year 1835, when he conceived the idea of assassinating the king. The immediate cause of his diabolical design was the suppression of a situation which he held, by order of the prefect of the Seine. Disguising his crime under the cloak of political enthusiasm, he leagued with himself one or two obscure persons, of pot-house politics, who hated the government of the citizen king. These were Pierre Morey, a saddler; Pepin, a grocer; and Victor Boireau, a maker of lamps. F. sketched the plan of an infernal machine with twenty barrels, that could be simultaneously discharged; got one made, and placed it in a house of the Boulevard-du-Temple. The review of the national guard held there, 28th July, 1835, afforded F. the opportunity he desired. On the approach of the king and queen, he fired his machine. Eighteen people were killed, among whom was marshal Mortier, who fell dead beside his sovereign. Louis Philippe, however, himself escaped with a mere scratch, and was able to continue the review. F. was immediately seized, and along with his accomplices, was tried, condemned, and executed, 16th Feb., 1836.

FIE'SOLE (anciently, *Fæsulæ*), one of the most ancient Etruscan cities, is situated on the crest of a hill, at about three miles' distance from Florence, of which it may be said to be the parent city. From the heights of F., the view presented by Florence and the neighboring valleys is gorgeous in the extreme. We find F. first mentioned in 225 B.C. during the great Gaulish war. Hannibal encamped here after crossing the Apennines. The city was next destroyed by Sulla in the social war (90–89 B.C.), who afterwards despatched thither a military colony. At the invasion or Tuscany by the Goths, F. also fell under their dominion, and being by nature and art a formidable stronghold, was numerously garrisoned by the barbarians. The growth of Florence during the middle ages gradually reduced it to insignificance. It is now a place of about 2,500 inhabitants. The only vestige of Etruscan structures still remaining is the cyclopean city wall, constructed of huge blocks of stone, many portions of which are wonderfully perfect. The site of the Etruscan fortress is now occupied by a convent, and interesting fragments of the foundations are often brought to light. The amphitheater and other remains belong to the Roman age. The very ancient church of St. Alexander, supposed to have originally served as a pagan temple, contains an altar dedicated to

Bacchus, the inscription of which is, however, illegible, owing to a fissure in the middle. Coins and other relics have been repeatedly dug up.

FIESOLE, Fra Giovanni da, one of the most eminent regenerators of Italian art, also known by the title of *Il beato Angelico,* was b. at Mugello in 1387. In 1407, he entered the Dominican order, and, together with his brother, consecrated his artistic abilities exclusively to sacred aims, illustrating various works of devotion with beautiful miniature designs. These early artistic efforts are remarkable for their rich effects of coloring, gorgeous illumination, and exquisite elaboration of the most minute ornamental details. Having achieved a high reputation as fresco-painter by some noble compositions with which he endowed his own and other convents, he was commissioned by Cosmo de' Medici, with the decoration of the church of Santa Annunziata and the convent San Marco. Each cell of the convent was adorned with a fine fresco of large dimensions, and amidst other paintings, one can still distinguish F.'s "Annunciation." The fame of this work induced pope Nicholas V. to summon him to Rome, and intrust him with the execution of a series of illustrations taken from the life of St. Laurence, destined to embellish the private chapel of St. Laurence in the Vatican. See Giangiacomo Romano, *Le Pitture della Cappello di Nicolò V.*, etc., (Rome, 1810). So rigid a disciplinarian was F., that no private or public work was ever undertaken without the formal consent of his superiors being obtained, and to them all pecuniary remuneration was transferred. The archbishopric of Florence, spontaneously offered him by the pope, was humbly declined. He died in Rome in 1454. The gallery of Florence possesses several pictures of F., still undimmed in brilliancy of coloring. One of these, the "Birth of John the Baptist," is a conception full of simple and winning grace. Some of the largest easel-compositions of this artist at present adorn the gallery of the Louvre; among those in the antechamber are the "Coronation of the Virgin," and the "Miracles of St. Dominico." One supreme aim pervades all the creations of F.—that of arousing lofty devotional feeling through the contemplation of the beautiful in art.

FIFE, an ancient wind-instrument of military music, in which the melody is produced by blowing through a hole in a reed or tube, while the escape of air is regulated by the fingers stopping or opening a number of other holes in different parts of the pipe. It has a compass of two octaves, from D on the fourth line of the treble clef to D above in altissimo. The fife figures in the sculptured memorials of the Argonautic expedition, and from that time to this has maintained its place as a simple yet effective instrument for martial purposes. It was common with English troops till the reign of James I., but was then discontinued; to be re-introduced by the duke of Cumberland at the siege of Maestricht in 1747. It is a universal favorite in the navy, and many a stirring air on drums and fifes has cheered the British sailor to deeds of daring.

In the infantry, there is a *fifer* to each company, and a fife-major to each battalion, the former receiving the daily pay of 1*s.* 1*d.*, the latter, who is a non-commissioned officer, 1*s.* 11*d.*

FIFE-NESS, a promontory of Scotland, the eastmost point of Fifeshire, in lat. 56° 17′ n., and long. 2° 35′ west. On the n., in the sea, are the dangerous Carr rocks, with an iron beacon 35 ft. high, which required six years to construct. F. is in view of the Isle of May and Bell Rock lights. In the Ness, trap rocks jut through the carboniferous strata, and the rocks contain small caves.

FIFESHIRE, a maritime, almost peninsular co. of the e. of Scotland, between the Firth of Forth on the s. and the Firth of Tay on the north. It is 44 m. in extreme length from n.e. to s.w., and 18 at its greatest breadth; area, 503 sq.m.; coast-line, 85 m., mostly rocky, and having many small ports. The surface is a succession of cultivated vales and hills. The hills rise in the west Lomond, 1713 ft., and Largo Law, 1020. The chief rivers are the Tay, Forth, Eden (20 m. long), and Leven (12). F. rests on old red sandstone, with trap rocks in the n., and carboniferous strata, with trap, in the south. There are many coal and iron mines, and lime quarries. The climate is dry, healthy, and mild on the Forth; but the valleys in the n. are much exposed to the full sweep of the e. and n.e. gales. The soil is a rich loam, or wet clay on till. The Howe of Fife, on the Eden, is mostly sandy and gravelly, and not very productive. In 1876, the total acreage under all kinds of crops, bare fallow, and grass, was 245,636; under corn crops, 87,533; under green crops, 47,509; clover, sandfoin, and grasses under rotation, 57,354. The total number of cattle reported the same year was 38,875; sheep, 69,159; pigs, 6,463; horses used for agriculture, etc., 10,222. F. has a greater number of proprietors, gentlemen's seats, and plantations, in proportion to its size, than any other Scotch county, and its coasts are thickly studded with towns and villages. The chief manufactures are linen, floor-cloth, and malt liquors. F. contains 61 parishes. Pop. '71, 160,735. It returns one member to parliament. The chief towns are Cupar (the county town). Dunfermline, St. Andrews, Kirkcaldy, East and West Anstruther, Burntisland, Crail, and Dysart. The ancient "kingdom of Fife" was the most cultivated, as well as the most warlike, of Scotch counties. It contains striking monastic, feudal, and palatial ruins at St. Andrews, Dunfermline, Falkland, and Lindores; many Celtic and Roman remains. Many of the events connected with the Scottish reformation took place in this county, especially at St. Andrews.

FIFTEENTH, a stop in English organs tuned two octaves above the diapasons, the lowest C pipe of which is two ft. long.

FIFTH MONARCHY MEN. Among the strange and whimsical forms of opinion which the religious and political fermentation of the 17th c. brought to the surface of society, and embodied in the shape of religious sects, were those of the Fifth Monarchy Men. The date which has been assigned to their first appearance is 1654. Notwithstanding the ridicule with which they have often been overwhelmed, their seems nothing in their tenets more objectionable than we find in those of many of the other sects of the period, and there is no reason to believe that the practices of their leaders exceeded in absurdity, or equaled in impiety, those of Robbins, Reeve, Muggleton, and other apostles of the Ranters. In common with most persons who hold the literal interpretation of prophecy, they believed in the four great monarchies of Antichrist marked out by the prophet Daniel; and quite consistently with Christian orthodoxy, they added to them a *fifth*—viz., the kingdom of Christ on earth. So far, there was nothing peculiar in their views. But their error was twofold. 1st. They believed in the immediate, or at least in the proximate, advent of Christ (a tenet which was common to them with the early church); and 2d. They held that the fulfillment of God's promise to this effect must be realized by the forcible destruction of the kingdom of Antichrist. Every obstacle which opposed itself to the setting up the Messiah's throne was to be thrown down, and what these obstacles were was a question for the solution of which the only criterion which presented itself was their own fanatical prejudices and hatreds. It is obvious that such doctrines in such times must have given rise to practical as well as speculative disorder. The Fifth Monarchy Men became extinct as a sect shortly after the restoration; a fact which, by depriving them of exponents of their own body, may have exposed them to misrepresentation (Marsden's *History of the Later Puritans*, p. 387). In politics, the Fifth Monarchy Men were republicans of the extremest section; and when their conspiracy to murder the Protector, and revolutionize the government, was discovered in 1657, their leaders, Venner, Grey, Hopkins, etc., were imprisoned in the Gate house till after the Protector's death. Amongst their arms and ammunition which was seized, was found a standard exhibiting a lion couchant, supposed to represent the lion of the tribe of Judah, with the motto, "Who will rouse him up?"—Neal's *Puritans*, vol. iv. p. 186. See also Carlyle's *Cromwell's Letters and Speeches*, vol. iii. p. 31.

FIG, *Ficus*, a genus of trees and shrubs belonging to the natural order *moraceæ*, and distinguished by having the flowers—male and female mixed—within an almost closed top-shaped fleshy receptacle, which enlarges to form the fruit, and incloses numerous one-seeded carpels, imbedded in its pulp. There are more than 100 species, some of them very large trees. Almost all belong to tropical and sub-tropical countries, of the vegetation of which they often form a most important feature. They abound in India, in every jungle and hilly situation, to the most northern Himalaya, and some of them are cultivated about every village. Both *F. religiosa* (the peepul) and *F. Rumphii* are held in veneration by the Hindus. The most notable species are the common F.; the banyan (q.v.); the peepul (q.v.), bo tree or sacred F. of India; the sycamore (q.v.); and the East Indian caoutchouc (q.v.) tree. The leaves of some species are entire, those of others are lobed. Several species of F. exhibit the character for which the banyan in particular has become celebrated, of sending roots straight down to the ground from their spreading branches, and thus multiplying the apparent stems, by which a vast canopy of branches and foliage is supported. The East Indian caoutchouc or india-rubber tree is remarkable for the exposure of its roots, which appear in masses above ground, extending on all sides from the base like great writhing snakes. Some figs are creeping or trailing shrubs, with slender stems, covering heaps of stones, or ascending trees like ivy.—Besides the common F., many species yield edible fruits, although none of them are nearly equal to it in value. Amongst them are the peepul (*F. religiosa*), *F. Benjamina*, *F. pumila*, *F. auriculata*, *F. Rumphii*, *F. Bengalensis*, *F. aspera*, *F. racemosa*, and *F. granatum*, all East Indian, also the sycamore of Egypt.—The milky juice of some species is bland and abundant, as of *F. Saussureana*, which has therefore been ranked among cow-trees. In other species, the milky juice is very acrid. That of the common F. produces a burning sensation on the tongue. That of *F. toxicaria*, a native of the Malayan islands, is used for poisoning arrows.—Lac (q.v.) is gathered from some species.—The leaves of *F. politoria* are so rough that they are used for polishing wood and ivory in India. The juice of the fruit of *F. tinctoria* is used in Tahiti to dye cloth; the color is at first green, but being acted on by the juice of a *cordia*, it becomes bright red. The bark supplies cordage, of which fishing-nets are made.

The COMMON F. (*ficus carica*) is a native of the east, as the specific name *carica* (from *caria*) imports; but it is now cultivated throughout the whole of the s. of Europe, and is even found naturalized there. Its cultivation has also extended to many warm countries. In North America, it is seldom to be seen further n. than Philadelphia; and it is not sufficiently hardy to be a common fruit tree in Britain, although even in Scotland figs may occasionally be seen ripened on a wall; and in the s. of England fig-trees are sometimes grown as standards, and a few small F. orchards exist. Protection is always given in some way during winter. Near Paris, and in

some other parts of the continent of Europe, fig-trees are so trained that the branches can be tied in bundles and laid along the ground, when they are covered with litter and earth. The F. is a low deciduous tree or shrub, with large deeply lobed leaves, which are rough above, and downy beneath. The branches are clothed with short hairs, and the bark is greenish. The fruit is produced singly in the axils of the leaves, is pear-shaped, and has a very short stalk; the color in some varieties is bluish-black; in others, red, purple, yellow, green, or white. The varieties in cultivation are numerous. In warm climates, the F. yields two crops in the year—one from the older wood (midsummer shoots of the preceding year), and a second from the young wood (spring shoots of the same year); but in colder regions the latter never comes to perfection. Fig-trees are propagated by seed, by suckers, etc.; very frequently by layers or by cuttings. In Britain, they are often to be seen in hothouses, and grow well in pots. Dried figs form an important article of food in the Levant; in more northern regions they are used for dessert, or for medicinal purposes, being applied to gumboils and other sores, and also administered in pulmonary and nephritic affections, and to relieve habitual constipation. The pulp contains about 62 per cent of a kind of sugar called *sugar of figs*. Figs are either dried in the sun or in ovens built for the purpose. Great quantities are annually imported into Britain from the Mediterranean. The best are mostly brought from Smyrna, and are known as *Turkey figs*, of which those called *Eleme* or *Elemi* are most highly esteemed. Figs of inferior quality are imported in considerable quantities in the form of *fig-cake*, pressed along with almonds into cakes somewhat like small cheeses. In the Levant, Portugal, and the Canaries, a spirit is distilled from fermented figs.

FIG'ARO, a dramatic character introduced on the Parisian stage in 1785 by Beaumarchais (q.v.) in his *Barbier de Seville* and his *Mariage de Figaro*. These plays, in which F., who coolly outwits every one, is first a barber and then a valet-de-chambre, secured for their author a brilliant reputation not only in France, but also in Germany, where many translations and adaptations of the pieces appeared. Mozart, Paesiello and Rossini also made them the basis of classic operas. Since their publication, the character of F. has stood as a type of cunning, intrigue, and dexterity. After the restoration of the Bourbons, a literary periodical, distinguished for its satirical talent, assumed the name.

FIGEAC, a t. of France, in the department of Lot, is situated in a valley surrounded by finely wooded hills on the right bank of the Sellé, 32 m. e.n.e. of Cahors. It is irregular, its streets are narrow, and badly planned, and its houses in general not well built, but the antiquity and quaintness of many of its buildings give it a picturesque and interesting appearance. It has two beautiful Gothic churches, one of them, that of St. Sauveur, has a choir of the 11th, a general superstructure of the 15th, and a modern front of the 19th century. F. owes its origin to a Benedictine monastery, founded by Pepin in 755 A.D. It has some cotton manufactures, and a trade in wine and cattle. Pop. '76; 5,660.

FIGHTING FISH, *Macropodus pugnax* or *Ctenops pugnax*, a small fresh-water fish, of the family *anabasidæ* (q.v.), a native of the s.e. of Asia, and particularly of Siam, where it is very commonly kept as gold-fishes are in Britain, but on account of its pugnacity. Two of these creatures when brought together, often rush immediately to combat, or it is even enough to introduce a looking-glass into the water, and the fish hastens to attack its own image. Fish-fights are a favorite amusement of the Siamese; the license to exhibit them yields a considerable annual revenue; and an extraordinary amount of gambling takes place in connection with them; not merely money and property, but children and liberty being sometimes staked. The F. F. has the anal and dorsal fins prolonged into tapering points. When the fish is quiet, its colors are dull; but when it is excited, they glow with metallic splendor, and "the projected gill-membrane, waving like a black frill around the throat, adds something of grotesqueness to the general appearance."

FIGLINÉ, or FIGHINE, a t. of central Italy, in the province of Florence, and 15 m. s.e. from Florence, on the left bank of the Arno. It is surrounded by a rectangular wall, and is traversed by a fine street, through which passes the great road from Florence up the valley of the Arno. The silk of F. is the best in Tuscany. Pop. '72, 5,673.

FIGUEIRA, a t. of Portugal, in the province of Beira, at the mouth of the Mondego, 23 m. w. by s. from Coimbra. Its harbor is a small bay or estuary of the Mondego, and is safe, but difficult of access, particularly for large vessels. It carries on, however, a considerable trade. The chief exports are salt, wine, vinegar, oil, dried fruits, and oranges. The wine shipped from F. is known in England by the names of *Figueira* and *Bairrada wine*. It is quite different both from port and from sherry. It is best when new, and does not bear keeping long. F. is much resorted to as a bathing-place. Pop. 6,000

FIGUERAS, a t. in the n.e. of Spain, is situated near the French frontier, in the province of Gerona in a fruitful district, 20 m. n.n.e. of the town of Gerona. Its streets are gloomy, but it has beautiful promenades. On a height near the town is the citadel of S. Fernando, the strongest fortress of Spain, and the key of the Pyrenees on their s. side, with accommodation for 20,000 men. This fortress has been so frequently taken

by the French, as to give rise to the remark, common enough among the Spaniards, that the citadel of S. Fernando, in time of peace, belongs to Spain, but in time of war to France. Pop. 7,400.

FIGUERAS, ESTANISLAO, b. 1819; a Spanish statesman on the ultra liberal side at first, but afterwards a supporter of Espartero. He was a member of the Cortes (national legislature) in 1851; and was re-elected in 1862. In 1866, he was complicated in the revolutionary movements, and was imprisoned by Narvaez. After the abdication of Isabella he was a judge and a member of the revolutionary committee. Again sent to the national legislature he became a prominent leader of the republican party, and after the abdication of king Amadeo in 1873, provisional president of the republic.

FIGUERO'A, FRANCISCO DE, 1540-1620; a Spanish poet, called "the divine;" educated in the university, and served in the army. He wrote the first good Spanish blank verse.

FIGUIER, GUILLAUME LOUIS, b. 1819; a French chemist and scientific writer. He commenced the study of chemistry under his uncle, was made doctor of medicine in 1841, and in the following year went to Paris to continue his studies. In 1846, he was appointed professor of the school of pharmacy in Montpellier. Afterwards, however, he returned to Paris, and in 1855, became scientific editor of *La Presse*. His contributions to scientific journals are numerous. Among the most important are: *Exposition et Histoire des principales Decouvertes Scientifiques Modernes; Histoire des Merveilleux dans les Temps Modernes;* and *Vies des Savants Illustres depuis l'Antiquite jusqu' au XIX Siecle. The Human Race; The Insect World; The World before the Deluge*, and several other popular works of this author have been translated into English.

FIGULINE. See POTTER'S CLAY.

FIGURANTES is the term applied in the ballet to those dancers that do not come forward alone, but dance in troops, and also serve to fill up the scene and form a background for the solo dancers.

FIG'URATE NUMBERS. The nature of F. N. will be understood from the following table:

	1,	2,	3,	4,	5,	6,	7, etc.
I.	1,	3,	6,	10,	15,	21,	28, etc.
II.	1,	4,	10,	20,	35,	56,	84, etc.
III.	1,	5,	15,	35,	70,	126,	210, etc.
		etc.				etc.	

The natural numbers are here taken as the basis, and the first order of F. N. is formed from the series by successive additions; thus, the 5th number of the first order is the sum of the first five natural numbers. The second order is then formed from the first in the same way; and so on.

If instead of the series of natural numbers, whose difference is 1, we take series whose differences are 2, 3, 4, etc., we may form as many different sets of figurate numbers. Thus:

	1,	3,	5,	7,	9, etc.
I.	1,	4,	9,	16,	25, etc.
II.	1,	5,	14,	30,	55, etc.
III.	1,	6,	20,	50,	105, etc.
		etc.			etc.

Or—

	1,	4,	7,	10,	13, etc.
I.	1,	5,	12,	22,	35, etc.
II.	1,	6,	18,	40,	75, etc.
III.	1,	7,	25,	65,	140, etc.
		etc.			etc.

The name *figurate* is derived from the circumstance, that the simpler of them may be represented by arrangements of equally distant points, forming geometrical figures. The numbers belonging to the first order receives the general name of *polygonal*, and the special names of *triangular*, *square*, *pentagonal*, etc., according as the difference of the basis is 1, 2, 3, etc. Those of the second order are called *pyramidal* numbers, and according to the difference of the basis, are triagonally, quadragonally, or pentagonally pyramidal. The polygonal numbers may be represented by points on a surface; the pyramidal by piles of balls.

The general formula for polygonal numbers, from which any particular one may be found by substituting the proper values for n and r is,

$$\frac{(r-2)\,n^2 - (r-4)\,n}{2}$$

where n= number of the term required, r = the denomination (3 if triagonal, 5 if pentagonal, etc.).

FIGURE, GRAMMATICAL. See METONYMY, and SYNECDOCHE, *ante*.

FIGURE, RHETORICAL, an ideal characterization, or illustration, which may be affirmed by one mind and denied by another, or affirmed and denied by the same mind under different conditions. It is usually an exaltation or a depreciation of a person or thing; as "Shakespeare was divine" in appreciation; or, "Tompkins is a goose," in depreciation. In any case its expression is in metaphor. See METAPHOR.

FIGURED BASS, in music, is a bass part with figures placed over the notes, which indicate the harmony to be played to each note, and serves as a guide to the accompanist. Ludovico Viadana is said to have been the inventor of F. B. in the 17th century.

FIGURE-STONE. See SOAP-STONE.

FIGWORT, of the order *scrophulariacea;* a flowering plant indigenous to North America and Europe; once thought valuable as a remedy for scrofula.

FIJI, FEEJEE, or VITI **ISLANDS,** an archipelago of about 312 islands in the southern Pacific ocean, situated in lat. 15° 30′ to 20° 30′ s., and long. 177° to 178° west. The group, which has a total area of 8,034 sq.m., almost equal to that of Wales, was discovered in 1646 by the Dutch navigator Tasman. The largest of the group, Viti-levu, or Big Viti, has an area of 4,479 sq.m.; Vanua-levu, of 2,486 sq.m.; and all the other islands together, of 1069 sq. miles. The islands are of volcanic origin, and although there are no longer any active volcanoes, yet hot springs, numerous earthquakes, and other signs testify that the subterranean forces are not quite extinct. They are all coral-girt; and to the approaching navigator appear clothed to their very summits with a dense and luxuriant vegetation. The surface is generally hilly, and the soil, owing to the abundant rain, is very productive. The windward sides of the islands are covered with thick forests, while to the leeward we see a grassy country dotted here and there with screw-pines. The most important river is the Kailevu, in the island of Vanua-levu, navigable for 60 m. from its mouth; the others are comparatively insignificant. The climate is extremely fine, and the country is said to be exceedingly healthy. The mean annual temperature is about 80° F., and the heat is tempered by the trade and other winds. Hurricanes, though rarely, do sometimes occur. In 1866, two severe storms burst over the entire group, doing great damage to the plantations.

The natural productions of Fiji or Viti are of the most varied description, and the vegetation is, on the whole, of a tropical nature. The mountain districts are well adapted to the growth of coffee; and though the coffee plantations were destroyed by the cyclone of 1866, the injury has been repaired, and the produce is again very considerable. Of late years, the European settlers have seriously begun the cultivation of the sugar-cane, which grows wild on the islands; and tobacco is raised in sufficient quantities for the consumption of the inhabitants, who are great smokers. There are many plants yielding oil and fat, of which the most important is the cocoa-nut palm. From 400 to 700 tons of the oil obtained from it are annually contributed to the missionaries by the natives. Of cotton, which was introduced into the islands some time ago, 650 cwt. were exported in 1864; 5,880 cwt. in 1866; and in 1873 about 14,000 cwt.; but in the last year the quality was considerably inferior. The staple article of food is the yam, by the ripening season of which the natives regulate their calendar, and which frequently attains the length of 8 ft., with a weight of 100 pounds. In other articles of vegetable diet, and especially in edible fruits, Viti is remarkably rich. Among the latter may be instanced bananas, plantains, the bread-fruit, oranges, shaddocks, the guayava, and pine-apples. Timber of excellent quality abounds, suitable both for house and ship-building. There are few animals in Viti; the live-stock of the natives consisting of the pig, the dog, and fowls. Sheep have been lately introduced, and promise to thrive fairly. Fish are numerous, both in the sea and rivers, and the trepang, or beche-de-mer fisheries, are carried on with vigor along the northern coast of Vanua-levu. Of the mineral resources of Viti we know little; copper and antimony are, however, said to exist.

The export trade of the islands has not been commensurate with their vast natural wealth. The value of exports in 1864 amounted to £19,800; in 1867, to £39,960; and in 1877, to £140,893; the imports for 1877 were £134,688 Cotton, cocoa-nut oil, tortoise-shell, and wool are the chief exports; while the imports embrace Manchester goods, iron-mongery, cutlery, wine, beer, spirits, groceries, etc. There are excellent harbors, among which that of Levuka, the chief town, situated on Ovalau, lately provided with a light-house, is the most important.

The native inhabitants are for the most part Melanesians, with dark complexions and long woolly hair. They are strong-limbed, muscular men; but are generally reported to be averse to continued labor. At all events the planters have had to look abroad for assistance in their fields. A considerable intermixture has taken place with the Polynesian Tonga islanders, and one of their chiefs has gained possession of the Windward islands (his residence being on Lakembor), and holds the title of viceroy of Viti. Up till 1854 cannibalism was universal in the islands; but since that date it has been suppressed, or at least banished to the most remote districts, through the efforts of the missionaries. About one third of the natives are professed Christians, and almost all have abandoned their idols. The Wesleyans, who first came in 1835, have made most converts; but the Roman Catholic priests, arriving in 1846, have also been successful. Many of the missionary schools are taught by natives, the great majority of whom can read and write their

own language. There are four newspapers published, one of which is a native production.

The native pop. was lately estimated at 146,000, of whom 70,000 were in Viti-levu, 33,000 in Vanua-levu, and 43,000 in the smaller islands; but a deadly epidemic of measles in 1875, introduced by a British man-of-war, reduced that number by at least one third. The white pop. was estimated in 1876 at 1569 persons, of various nationalities, but most of them British subjects from other colonies.

The later history of Viti has been very tumultuous, and to this fact is undoubtedly owing the small extent of its commerce. In 1855, Thakaumba, chief of Bau, was made responsible for a debt due from the natives to the Americans, and this resulted in his election to the dignity of "Tui Viti," or king of Viti. In 1857, he offered to cede Viti to Great Britain, in consideration of the payment of his debt to America, stipulating only for the retention of his title and authority over the natives. This offer, however, was refused by the British government in 1862, after sending out a deputation. A "Polynesian company" was then started, which undertook to clear off the debt, in return for certain valuable privileges, but ultimately it collapsed. In 1869 the president of the United States refused the protectorate of the islands. From that date until 1873, the government sanctioned three or four unsuccessful constitutions. The cession of the islands to Britain was renewed in 1873, and accepted, and on Sept. 30, 1874, they were annexed as a crown colony. Under sir Arthur Gordon's governorship, they have made great material and political progress.

FILADEL'FIA, a t. of s. Italy, in the province of Catanzaro, 18 m. w.s.w. from Catanzaro, on the western side of the Apennines, and on a branch of the Angistola. Pop. 5,700.

FILANGIE'RI, CARLO, 1783–1867; son of Gaëtano; an officer in the French, and afterwards in the Neapolitan, army; an impetuous, rash spirit. He was concerned in many duels, in one of which he killed gen. Franceschi. Murat made him a general. He was always a supporter of absolute power, and in 1848 aided the opposition to the revolutionary movement by taking Messina after a fierce bombardment. He reduced Sicily to submission, and was made governor-general with dictatorial powers.

FILANGIE'RI, GAËTANO, 1752–88; an Italian writer on public polity. His *Scienza della Legislazione* appeared in 1780, and had great success. But this and earlier writings fell under the censure of the papal church, and were condemned by the congregation of the Index. His works have had much influence on European thought.

FILA'RIA. See GUINEA-WORM and THREAD-WORM.

FILBERT. See HAZEL.

FILE (Fr. *file*, a row, Lat. *filum*, Ital. *fila*, *filo*), in a military sense, is used to signify any line of men standing directly behind each other, as *rank* refers to men standing beside one another. In ordinary formations of the present day, a battalion stands two deep, or in two ranks—front and rear—wherefore a file consists of two men. Sometimes, however, the battalion may be formed much more solidly, as in a square, when the file comprises a far larger number. The number of files in a company describes its width, as the number of ranks does its depth. thus, 100 men in "fours deep" would be spoken of as 25 files in 4 ranks.

FILE—FILING. A file is a steel tool, having its surface covered with teeth or serratures, and used for cutting down and shaping metals and other hard substances. There is little doubt that in the earlier stages of metal-working, when bronze implements first superseded those of stone, rough stones were used for the purposes to which files are now applied; nevertheless, the use of files dates from high antiquity. They are mentioned in the Old Testament in the first book of Samuel, xiii. 21, also in the *Odyssey*.

Files are made of almost every conceivable shape, to suit the very varied purposes to which they are applied—flat, square, round or *rat-tail*, triangular, half-round, feather-edged, etc., besides being variously bent, in order to get at intricate work. Nearly all these files are made thicker in the middle, or "bellied," the object of which will be explained under FILING.

Files require to be made of the very best steel, which is first forged into the required shape, and is then called a "blank." The blanks are then finished more accurately to the required form by grinding, planing, or filing.

The blanks thus prepared and well softened (see TEMPERING) are next handed to the cutter, who sits astride on a low bench or stool, and has before him a stone anvil, with a flat piece of pewter laid upon it. The blank is held upon the anvil, with its tang towards the cutter, by means of a long loop of leather-strap, into which the cutter places his foot. He then cuts the teeth by striking with a hammer a short stout chisel, held obliquely at an angle of about 12° or 14° from the perpendicular. The object of this will be easily understood; for, if the chisel were perpendicular, a furrow like the letter V would be indented, and an equal burr struck up on each side; but, instead of this, a cutting tooth like that of a saw, but with less obliquity, is required; this is effected by the obliquity of the chisel, and a burr is thrown up on one side only—viz., towards the tang.

The astonishing regularity observable in the distance between the teeth is secured in

this way: The cutting is commenced at the point of the file; the chisel is then drawn backwards, laid upon the blank, and slid forwards till it reaches the burr raised by the last cut; the blow is now struck, and another tooth and burr produced, which serves as a guide for the next cut; and so on. The distance between the teeth thus depends on the force of the blow, and the obliquity of the cut; for the heavier the blow, the greater the ridge or burr, and the obliquity determines the distance of the cut from the burr; the skill of the workman consists, therefore, in the precise regulation of the blows.

Most files are double cut—that is, they have two series of *courses* of chisel-cuts, which are oppositely inclined at an angle of about 55° to the central line of the file. The second course is made in the same manner as the first, but with lighter blows, and is usually somewhat finer than the first. This angular crossing converts the ridges into pointed teeth. Files used for soft metals which are liable to clog the teeth, are single cut—that is, they have but one course of cuts. Taper files have the teeth finer towards the point. Rasps for wood are cut with pointed chisels; each tooth being an angular pit with a strong burr, instead of a long furrow. The newly cut teeth in the soft steel are preserved from injury by being laid upon the softer pewter block before referred to. The rapidity with which the blows are struck varies with the fineness of the file; 60 or 80 cuts are commonly made per minute.

Files have to be very carefully hardened and tempered. If heated too strongly, or made too hard, the steel is so brittle that the teeth tear off; if too soft, they wear down rapidly, and the file soon becomes useless. Great care is also required in keeping them straight, as the sudden cooling necessary for hardening is very apt to warp the steel.

At first sight, it would appear, from the simplicity and continual repetition of the movements required in file-cutting, and the precision and regularity of the work, that it is an operation specially adapted for machinery. Many attempts have been made to cut files by machinery, but with only partial success; the chief difficulty arises from the necessity of modifying the force of the blow to suit the hardness of the steel. It is practically impossible to supply a large number of blanks all of exactly the same hardness; and if the machine be adjusted to suit the hardness of one blank, it may strike too heavy or too light a blow for the next; whereas the workman *feels* at once the hardness of the steel he is working upon, and adjusts his blows accordingly.

Filing.—To the uninitiated, this may seem a simple operation of rubbing one piece of metal upon another, and requiring only muscular strength and no skill. This is far from being the case, for a skillful workman will, in a given time, with a given amount of muscular work, cut away a far greater quantity of metal with a file than one who is unskillful, for he makes every tooth *cut into* the work, instead of *rubbing over* it. To do this, he must adapt the pressure and velocity of motion of the file to the coarseness of its teeth, and the hardness, brittleness, and toughness of the material he is working upon.

To *file flat*, that is, to avoid rounding the sharp edges of a narrow piece of work, is very difficult, and some years of continual practice is required before an apprentice can do this well, especially in "smoothing up" or finishing work before polishing, and there are some who never succeed in filing, smoothing, and polishing without rounding the edges of fine work. The power of doing this constitutes the main test of skill among mathematical instrument makers and other metal-workers. The flattest surface can be obtained by laying the work, where its form admits, upon a piece of cork held in the vise, and filing it with *one hand*, the pressure on the file being communicated by the forefinger.

It is mainly to aid the workman in filing flat that the rounded or bellied form is given to files; this partially compensates the tendency of the hands to move in a curved line with its convexity upwards when they move forward and apply pressure, as in the act of filing.

FILE FISH. See Balistes, *ante*.

FILIATION, the correlative of paternity. In the law of Scotland, the F. of a child is the process by which its paternity is determined. The general rule that the father is he whom the marriage points out (*pater est quem nuptiæ demonstrant*), is a presumption which may be overcome by showing its impossibility in point of fact—as, for example, where the husband is impotent, or where he has been absent from his wife during the period between the eleventh solar and the sixth lunar month preceding the birth. As regards natural children, a *copula* more than ten months before birth does not filiate, but it forms an important adminicle of proof, which, till the passing of 16 Vict. c. 20, it was held might be completed by the oath of the mother. As to the effect of that statute on the previously existing law, see Evidence, and Semiplena Probatio.

FILIBUSTERS, another name for the piratical adventurers whose origin and history are treated of under *Buccaneers* (q.v.). Recently it has become familiar to English ears as the designation of certain lawless adventurers belonging to the United States, who have attempted violently to possess themselves of various countries in North America. The plea urged by these persons has generally been, that such countries were a prey to anarchy and oppression, and could only attain to prosperity by annexation to the United States, and the introduction of "democratic" institu-

tions—among which, strange to say, slavery stands prominent. The most notorious of these filibusters was the late William Walker, whose expedition against Nicaragua in 1855 was so far successful that he kept his ground in that country for nearly two years. At last, he was driven out by a combination of the various states of Central America. He was subsequently captured and shot, Sept. 12, 1860, at Truxillo, in Central America, in the course of another piratical expedition.

FILICA'JA, VINCENZO, a lyrical poet of Italy, was b. at Florence, of an ancient but impoverished family, in 1642. Deeply wounded, while yet a youth, in his affections, he resolved to dedicate his undivided genius to heroic, martial, and sacred themes, for swearing all amatory compositions for the future, and perversely consigning his exquisite love inspirations to the flames. In six sublime odes, F. celebrated the deliverance of Vienna in 1683 from the besieging forces of the Turks, chiefly effected by the heroism of John Sobieski, king of Poland, and of Charles duke of Lorraine. On the publication of the odes in Florence in 1684, F. became, almost in spite of himself, famous, and attracted the notice of queen Christina of Sweden, an ardent admirer and munificent protectress of Italian letters and genius. Relieved from harassing pecuniary embarrassments by the liberal patronage of Christina, F. was enabled, with undisturbed powers, to devote himself to composition, some of his most touching verses being addressed to his royal benefactress. Patriotic sonnets, the grandest of which is a lament over the internal weakness of Italy—*Italia, Italia, O tu cui feo la sorte*—and heroic odes, severely classic in form, are the chief works of Filicaja. His career as patriot, citizen, and man, won him reverence and love as universal as was the admiration accorded to his works. In advanced age, he was appointed judge and senator, and in 1702 was called to one of the highest magisterial offices in Florence, where he died in honored peace, Sept. 24, 1707. His works, under the title of *Poesie Toscane di Vincenzo da Filicaja, Senatore Fiorentino e Accademico della Crusca,* were published after his death. The best edition is that of Venice (2 vols. 1762), containing both the Italian and Latin verses of the author.

FI'LICES. See FERNS.

FILIGREE, from the Italian *filigrana* (*filo,* a thread or wire, and *grano,* a grain or bead), the old filigree-work being ornamented with small beads. The name is now applied to delicate wire-work ornaments, usually made of gold of silver wire, which is twisted into spirals and other convoluted forms; and these spirals, etc., are combined to form a sort of metallic lace-work, which is shaped into brooches, ear-rings, crosses, head ornaments, and others of a very light and elegant character. This work is chiefly done in Malta, India, Genoa, the Ionian islands, and some parts of Turkey. It sometimes receives the general name of *Maltese work.*

FILIGREE (*ante*). This art may be said to consist in curling, twisting, and plaiting fine pliable threads of metal, and uniting them at their points of contact with gold or silver solder and borax, by the help of the blow-pipe. Small grains or beads of the same metals are often set in the eyes of volutes on the junctions, or at intervals at which they will effectively set off the wire-work. The more delicate tracery is generally protected by framework of stouter wire. Brooches, crosses, ear-rings, and other personal ornaments of modern filigree are usually surrounded and subdivided by bands of square or flat metal, giving consistency to the filling up, which would not otherwise keep its proper shape. Probably the oldest existing jewel work is that which has been found by Belzoni, Wilkinson, Mariette, and other Egyptian discoverers in the tombs of Thebes and similar places, in which filigree forms an important feature of the ornamentation. Amongst the jewelry now in the British museum, and in the Louvre in Paris, are examples of the round plaited gold chains of fine wire, such as are still made by the filigree workers of India, and known as Trichinopoly chains. From some of these are hung smaller chains of finer wire, with minute fishes and other pendants fastened to them. Most of the rings found in these collections are whipped with gold wire soldered to the hoop. The Greek and Etruscan filigree of about 3,000 years ago is of extraordinary fineness and perfect execution. A number of ear-rings and other personal ornaments found in central Italy are preserved in the Campana collection of the Louvre and amongst the gems of the British museum. Almost all of them are made of filigree. Some ear-rings are in the form of flowers of geometric design, bordered by one or more rims, each made up of minute volutes of gold wire, and this kind of ornament is varied by slight differences in the way of disposing the number or arrangement of the volutes. But the feathers and petals of modern Italian filigree are not seen in these ancient designs. In many ear-rings, chains hang from the upper part, and tiny birds, such as doves or peacocks, covered with enamel, are set amongst these hanging ornaments. Other Etruscan ear-rings are short tubes of gold, half or three quarters of an inch long by half an inch or less in diameter, with a plate of gold attached to the side, and the whole surface covered with filigree soldered on in minute patterns. Many rings resemble fishes with the tails in their mouths, made up of thin plates of gold and wire work of the same metal. A beautiful collection of antique examples of Greek jewelry found in the Chersonese and along the coast of Asia Minor was placed, before the Crimean war, in a museum at Kertch. Many bracelets and necklaces in that collection are made of twisted wire, some in as many as seven rows of plaiting, with clasps in the shape of

heads of animals of beaten work. Others are strings of large beads of gold, with grains of gold, or with volutes and knots of wire soldered over the surface. In the British museum a scepter, probably that of a Greek priestess, is covered with plaited and netted gold wire, finished with a sort of Corinthian capital and a boss of green glass. It is probable that in India and various parts of central Asia filigree has been worked from the most remote period without any change in the designs. Whether the Asiatic jewelers were influenced by the Greeks settled on that continent, or merely trained under traditions held in common with them, it is certain that the Indian filigree workers retain the same patterns as those of the ancient Greeks, and work them in the same way, down to the present day. Wandering workmen are given so much gold, coined or rough, which is weighed, heated in a pan of charcoal, beaten into wire, and then worked in the courtyard or veranda of the employer's house, according to the designs of the artist, who weighs the complete work on restoring it, and is paid at a specified rate for his labor. Very fine grains or beads and spines of gold, scarcely thicker than a coarse hair, projecting from plates of gold are methods of ornamentation still used. This work requires the utmost delicacy of hand, and is of extraordinary richness of effect. Signor Castellani, the modern Cellini of Italy, who has made the unique filigree of the Etruscans and Greeks his special study, found it for a long time impossible to revive this particular process of delicate soldering; but the difficulty has been overcome at last. Passing to later times, we may notice in many collections of mediæval jewel work, reliquaries, covers for the gospels, etc., made either in Constantinople from the 6th to the 12th c., or in monasteries in Europe, in which Byzantine goldsmiths' work was studied and imitated. These objects, besides being enriched with precious stones, polished but not cut into facets, and with enamel, are often decorated with filigree. Large surfaces of gold are sometimes covered with scrolls of filigree soldered on; and corner pieces of the border of book covers, or the panels of reliquaries, are not unfrequently made up of complicated pieces of plaited work alternating with spaces incrusted with enamel. Byzantine filigree work occasionally has small stones set amongst the curves or knots. In the n. of Europe, the Saxons, Britons, and Celts were from an early period skillful in several kinds of goldsmiths' work. As early as the middle of the 5th c., the brooches and other personal ornaments of the "Littus Saxonicum" in England were encrusted with enamel work varied with borders or centers of filigree. The Irish filigree work is more thoughtful in design and more varied in pattern than that of any period or country that could be named. It reached its highest perfection, according to Dr. Petrie, in the 10th and 11th centuries. The royal Irish academy in Dublin contains a number of reliquaries and personal jewels, of which filigree is the general and most remarkable ornament. The "Tara" brooch has been copied and imitated, and the shape and decoration of it are well known. Instead of fine curls or volutes of gold thread, the Irish filigree is varied by numerous designs, in which one thread can be traced through curious knots and complications, which, disposed over large surfaces, balance one another, but always with special varieties and arrangements difficult to trace with the eye. The long threads appear and disappear without breach of continuity, the two ends generally worked into the head and tail of a serpent or a monster. The reliquary containing the "bell of St. Patrick" is covered with knotted work in many varieties. A two-handled chalice, called the "Ardagh cup," found near Limerick a few years since, has belts, bosses at the junctions of the handles, and the whole lining of the foot ornamented with work of this kind of extraordinary fineness. The late lord Dunraven numbers forty varieties of pattern of this cup alone. Much of the mediæval jewel work all over Europe down to the 15th c., on reliquaries, crosses, crosiers, and other ecclesiastical goldsmiths' work, is set off with bosses and borders of filigree. Filigree in silver was practiced by the Moors of Spain during the middle ages with great skill, and was introduced by them and established all over the peninsula, where silver filigree jewelry of delicate and artistic design is still made in considerable quantities. The manufacture spread over the Balearic islands, and among the populations that border the Mediterranean, and continues all over Italy, and in Albania, the Ionian islands, and many other parts of Greece. That of the Greeks is sometimes on a large scale, with several thicknesses of wire alternating with larger and smaller bosses and beads, sometimes set with turquoises, etc., and mounted on convex plates, making rich ornamental head-pieces, belts, and breast ornaments. Filigree silver buttons of wire-work and small bosses are worn by the peasants in most of the countries that produce this kind of jewelry. Silver filigree brooches and buttons are made also in Denmark, Norway, and Sweden. Little chains and pendants are added to much of this northern work. Beautiful specimens have been contributed to the various international exhibitions. Some very curious filigree was brought from Abyssinia after the capture of Magdala—arm guards, slippers, cups, etc. They are made of thin plates of silver, over which the wire-work is soldered. Filigree is subdivided by narrow borders of simple pattern, and the intervening spaces are made up of many patterns, some with grains set at intervals. Great interest has been felt in the revival of the designs of antique jewelry by Signor Castellani. He collected examples of the peasant jewelry still made in many provinces of Italy on extraordinary designs preserved from a remote antiquity. Most of the decoration is in filigree of many varieties. It was in part through the help of workmen in remote villages, who retained the use of various kinds of solders, long forgotten else-

where, that the fine reproductions of antique gold filigree have been so beautifully executed in Italy, and by Italian jewelers.—[From *Ency. Brit.*, 9th ed.]

FILIOQUE, a Latin term signifying "and from the Son," designates a controversy between the Greek and Latin churches which has been prolonged through many centuries. The council of Nicæa, 325 A.D., while it affirmed that the Son is of the same substance with the Father, simply added that it believed in the Holy Spirit. The council of Constantinople, 381 A.D., declared that the Spirit is of the same substance with the Father and the Son, and that he proceedeth from the Father. This is in accordance with the teaching of Christ to his apostles, and, while it does not affirm that he proceedeth from the Father *only*, certainly seems to imply it. In the Latin church the idea of the double procession seems always to have prevailed. Augustin taught clearly that the spirit proceedeth from both the Father and the Son. At the third synod of Toledo, 589 A.D., which, however, had not ecumenical authority, "filioque" was added to the creed. In the eastern church the addition was not accepted. In 809 pope Leo III. refused to sanction the addition to the creed, but approved the doctrine as scriptural and sound. In the 9th c., when the controversy arose between the patriarch of Constantinople and the pope which caused the schism between the churches, the doctrinal difference was discussed, and the western church was reproached for having departed from the faith. At length Rome did add the clause to the creed, but not publicly; no decretal or other document announced it to the church. In 1014, when Henry II. was crowned at Rome, the creed with the added clause was chanted at high mass. In 1274, at the council of Lyons, a vain attempt to reconcile the two portions of the church was made. In 1439, at the council of Florence, the effort was renewed, at first with apparent success; but the Greek church would not accept the compromise that had been agreed on. Later efforts have been equally unsuccessful. Yet the two churches both maintain the doctrine of the Trinity, while they differ only in the vain endeavor to understand and explain it. And even in this there is substantial agreement between them, for the Greek church admits the doctrine of a double procession in a sense which is in accordance with Scripture and is, probably, not essentially different from that which the Latin church maintains. In 1718, the Greek patriarch and synod made the following declaration: "We thus believe that there is a twofold procession of the Holy Spirit, the one natural, eternal, and before time, according to which the Holy Spirit proceeds from the Father alone; the other, temporal and deputative, according to which the Holy Spirit is externally sent forth, derived, proceeds, and flows from both the Father and the Son for the sanctification of the creature." Both these processions are contained in the words of Christ: "The Comforter, *whom I will send unto you from the Father;* even the Spirit of truth *who proceedeth from the Father.*" At a conference of Old Catholic, Anglican, and eastern theologians, held at Bonn in 1874, there was a general agreement that the words *filioque* had been added to the creed in an illegal manner; and that peace and unity would be greatly promoted if the entire church could find a way to restore the creed to its original form, without sacrificing the doctrine held by the western churches. Thus far there has been no announcement of any progress towards the accomplishment of the desired unity.

FI'LIPO-D'ARGIRO, SAN, a t. of Sicily, in the province of Catania, and about 30 m. w.n.w. of the town of that name, stands on the right bank of the Traina, in an exceedingly fertile district. It contains a ruined Saracenic castle, and several religious edifices. Saffron of good quality, and in considerable quantity, is grown in the vicinity. Pop. '72, 11,876. San Filipo-D'Argiro stands on the site of the ancient Sikelian city of Agyrium, the birthplace of Diodorus Siculus, and which, about 400 B.C., is said to have had 20,000 citizens.

FILLAN, SAINT. Two Scoto-Irish saints of the name of Fillan appear in the church calendars, and have left their mark on the topography of Scotland and Ireland. (1.) ST. FILLAN, or Faolan, surnamed the leper, had his yearly festival on the 20th of June. His chief church in Scotland was at the e. end of loch Erne, in Perthshire, where "St. Fillan's well" was long believed to have supernatural powers of healing. A seat in the rock of Dunfillan still keeps the name of "St. Fillan's chair;" and two cavities beside it are said to have been hollowed by St. F.'s knees in prayer. His Irish church is at Ballyheyland (anciently called Killhelan or Kill Faelain), in the barony of Cullenagh, in Queen's county. (2.) ST. FILLAN, the abbot, the son of St. Kentigerna of Inchcaileach, in loch Lomond, lived in the 8th c., and had his yearly festival on the 7th or 9th of Jan. He joined the monastery of St. Mund on the Holy loch, and after that saint's death, succeeded him as abbot. His chief church in Scotland was in Perthshire, in the upper part of Glendochart, which takes from him the name of Strathfillan. Here, a well-endowed priory, dedicated in his honor, was repaired, or rebuilt, in the beginning of the 14th century. King Robert Bruce made a grant of money to the work, in gratitude, probably, for the miraculous encouragement which he was said to have received on the eve of Bannockburn from a relic of the saint—one of his armbones inclosed in a silver case. Another relic of St. F.—the silver head of his crosier, or pastoral staff—has been preserved to our time. It is called the "coygerach," or "quigrich," and appears in record as early as the year 1428, when it was in the

hereditary keeping of a family named Jore or Dewar, who were believed to have been its keepers from the time of king Robert Bruce. They had half a boll of meal yearly from every parishioner of Glendochart who held a merk land, and smaller quantities from smaller tenants; and they were bound, in return, to follow the stolen cattle of the parishioners wherever their traces could be found within the realm of Scotland. The quigrich, besides its virtues in the detection of theft, was venerated also for its miraculous powers of healing. In 1487, the right of keeping it was confirmed to Malice Doire, or Dewar, by king James III., in a charter, which was presented for registration among the public records of Scotland so lately as the year 1734. Sixty years later, the quigrich still commanded reverence; but its healing virtues were now only tried on cattle, and its once opulent keepers had fallen to the rank of farm-laborers. It was publicly exhibited in Edinburgh, in the year 1818, before being carried to Canada, by its hereditary keeper, Archibald Dewar. His son, Alexander Dewar, desirous that it should be restored to Scotland, came to an arrangement whereby, partly by purchase and partly by gift, it became the property of the society of antiquaries of Scotland. It was described by Dr. Daniel Wilson in a paper in the *Canadian Journal*, No. xxiv., reprinted as *The Quigrich, or Crosier of St. Fillan* (Toronto, 1859); see also *Historical Notices of St. Fillan's Crosier* by Dr. Stuart, reprinted from the *Proceedings of the Society of Antiquaries of Scotland*, vol. xii. (1877). A linn in the river Fillan, or Dochart, in Strathfillan, was long believed to work wonderful cures on insane persons, who were immersed in the stream at sunset, and left bound hand and foot till sunrise in the ruins of the neighboring church of St. Fillan. A hand-bell, which bore the name of St. Fillan, was also believed to work miracles.

FILLET, in architecture, a small space or band like a narrow ribbon used along with moldings.

FILLET, in heraldry, is an ordinary, which, according to Guillim, contains the fourth part of the chief.

FILMER, Sir Robert, an English writer of the 17th c., who upheld in the extreme degree "the divine right of kings." He assumed that the father was the ruler of the family and the king was the father of his people, and both were absolute rulers with power even to take life. It is doubtful if his opinions, which occasioned violent discussion in his day, would have been heard of in these times, if Locke had not undertaken, in his *Treatise on Government*, seriously to controvert them.

FILLMORE, a co. in s.e. Minnesota, on the Iowa border, on Root river, intersected by the Southern Minnesota railroad; 864 sq.m.; pop. '75, 28,337. The surface is undulating prairie, with forests of good timber. The soil is fertile; productions, corn, wheat, oats, butter, etc. Limestone underlies much of the surface. Co. seat, Preston.

FILLMORE, a co. in s.e. Nebraska, drained by a tributary of Big Blue river; 576 sq.m.; pop. '75, 5,373. Undulating surface, and fertile soil, but not much cultivated. Co. seat, Geneva.

FILLMORE, Millard, an American statesman, ex-president of the United States, was b. on 7th Jan., 1800, at Summer Hill, in the state of New York. Born of English parents, in rather straitened circumstances, all the education he received was the very imperfect instruction furnished by the village school. At the age of 15, he was sent to the county of Livingston, there to learn the drapery trade, and soon afterwards was bound apprentice to a wool-carder in his native village. During the four years he labored at this occupation, he used every means at his disposal to cultivate his mind, devoting his evenings to reading and study. In his 19th year, he made the acquaintance of a lawyer named Wood, who discovering in the young man talents worthy of a loftier sphere, took an interest in him, and offered him a situation in his office, at the same time supplying him with funds for the prosecution of his studies for the legal profession. The attention bestowed upon him by his benefactor was not thrown away. He entered with ardor upon the course thus marked out for him, and in order that he might not be too great a burden upon his friend, devoted a part of his time to conducting a school. He removed to Buffalo in 1821 in order to complete his studies, and in 1823 was admitted a member of the bar. A brilliant career was thus opened up for him, and he delayed not to pursue it. He gradually acquired both means and reputation. In 1829, he began his political career, being in that year chosen as a representative of the county of Erie in the legislature of New York, where he entered the ranks of the whig party, at that time in opposition. Here his probity and modesty soon gained him universal esteem. He was mainly instrumental in procuring the abolition of imprisonment for debt in the state of New York. In 1832, F. was elected a member of congress, and such were the statesmanlike qualities displayed by him, that he was several times re-elected; but in 1844, he resumed his profession of advocate. In 1847, however, he again returned to public life, being elected by a large majority to the post of comptroller of New York; and in the following year he was made vice-president of the United States. The unexpected death of gen. Taylor in July, 1850, leaving the office of president vacant, F. was raised to that high office, which he held till 1853. His presidency was marked by the passing of some very salutary measures, notwithstanding that his party were in the minority. He promoted as far as he could the progress of

exploration and discovery, at home and abroad. In 1855, F. visited Europe, and on his return in 1856, he was again nominated for the presidency, but was not returned. F. took no active part in the civil war; though nominally he sided with the union. After the expiry of his term of office, he retired to Buffalo, where he died in 1874.

FILTER—FILTRATION. When solid matter is suspended in a liquid in which it is insoluble, it may be separated by various means. Under the article FINING, various methods of causing such suspended matter to collect together and sink to the bottom or float on the surface, and thereby clearing the liquid, are described. The process of filtration consists in passing the liquid through some porous substance, the interstices of which are too small to admit of the passage of the solid particles, the principle of the action being the same as that of a sieve; but as the particles of fluids are immeasurably small, the pores must be extremely minute.

One of the simplest forms of filter is that commonly used in chemical laboratories for separating precipitates, etc. A square or circular piece of blotting-paper is folded in four, the corner where the four folds meet is placed downwards in a funnel, and one side is partly opened, so that the paper forms a lining to the funnel. The liquid passes through the pores of the paper, and the solid matter rests upon it. The chief advantages of this filter are its simplicity, and the ease with which the solid matter may be removed and examined.

A simple water-filter for domestic purposes is sometimes made by stuffing a piece of sponge in the bottom of a funnel or the hole of a flower-pot, and then placing above this a layer of pebbles, then a layer of coarse sand, and above this a layer of pounded charcoal three or four inches in depth. Another layer of pebbles should be placed above the charcoal, to prevent it from being stirred up when the water is poured in. It is obvious that such a filter will require occasional cleaning, as the suspended impurities are left behind on the charcoal, etc. This is best done by renewing the charcoal, etc., and taking out the sponge and washing it. By a small addition to this, a cottage-filter may be made, which, for practical use, is quite equal to the most expensive filters of corresponding size. It consists of two flower-pots, one above the other; the lower one is fitter with the sponge and filtering layers above described, and the upper one with a sponge only. The upper pot should be the largest, and if the lower one is strong, the upper one may stand in it, or a piece of wood with a hole to receive the upper pot may rest upon the rim of the lower one. The two pots thus arranged are placed upon a three-legged stool with a hole in it, through which the projecting part of the lower sponge passes, and the water drops into a jug placed below. The upper pot serves as a reservoir, and its sponge stops the coarser impurities, and thus the filtering layers of the lower one may be used for two or three years without being renewed, if the upper sponge be occasionally cleaned. Care must be taken to wedge the upper sponge tightly enough, to prevent the water passing from the upper pot more rapidly than it can filter through the lower one.

A great variety of filters are made on a similar principle to the above, but constructed of ornamental earthenware or porcelain vessels of suitable shape. It would occupy too much space to enter upon the merits of the filters of different makers, especially as there is really very little difference between them in point of efficiency, and nearly all the domestic filters that are offered for sale are well adapted for their required purpose. In purchasing a filter, the buyer must not be satisfied with merely seeing that the water which has passed through it is rendered perfectly transparent—this is so easily done by a new and clean filter—but he should see that the filter is so constructed as to admit of being readily cleansed, for the residual matter must lodge somewhere, and must be somehow removed. When large quantities of water have to be filtered, this becomes a serious difficulty, and many ingenious modes of overcoming it have been devised. In most of these, water is made to *ascend* through the filtering medium, in order that the impurities collected on it may fall back into the impure water. Leloge's ascending filter consists of four compartments, one above the other; the upper part, containing the impure water, is equal in capacity to the other three. This communicates by a tube with the lower one, which is of small height. The top of this is formed by a piece of porous filtering-stone, through which alone the water can pass into the third compartment, which is filled with charcoal, and covered with another plate of porous stone. The fourth compartment, immediately above the third, receives the filtered water, which has been forced through the lower stone, the charcoal, and the upper stone. A tap is affixed to this, to draw off the filtered water, and a plug to the second or lower compartment, to remove the sediment. At the top of the tube by which the first and second compartments communicate, a sponge may be placed to stop some of the grosser impurities.

Since 1831, when this filter was contrived, a number of ascending filters have been patented, many of them being merely trifling modifications of this. Bird's siphon filter is a cylindrical pewter vessel containing the filtering media, and to it is attached a long coil of flexible pewter pipe. When used, the cylinder is immersed in the water-butt or cistern, and the pipe uncoiled and bent over the edge of the cistern, and brought down considerably below the level of the water. It is then started by applying the mouth to the lower end, and sucking it till the water begins to flow, after which it continues to

do so, and keeps up a large supply of clear water. This, of course, is an ascending filter, and the upward pressure is proportionate to the difference between the height of the water in the cistern and that of the lower end of the exit tube. See SIPHON. Sterling's filtering tanks are slate cisterns divided into compartments, the water entering the first, then passing through a coarse filter to a second, and from there through a finer filter to the main receptacle, where the filtered water is stored and drawn off for use.

A common water-butt or cistern may be made to filter the water it receives by the following means: Divide the cistern or butt into two compartments, an upper and a lower, by means of a water-tight partition or false bottom; then take a wooden box or small barrel, and perforate it closely with holes; fit a tube into it, reaching to about the middle of the inside, and projecting outside a little distance; fill the box or barrel with powdered charcoal, tightly rammed, and cover it with a bag of felt; then fit the projecting part of the tube into the middle of the false bottom. It is evident that water can only pass from the upper to the lower compartment by going through the felt, the charcoal, and the tube, and thus, if the upper part receives the supply, and the water for use is drawn from the lower part, the whole will be filtered. It is easily cleaned by removing the felt and washing it.

Various means of compressing carbon into solid porous masses have been patented, and filters are made in which the water passes through blocks of this compressed carbon. Most of these are well adapted for the purpose, but their asserted superiority over filters composed of layers of sand and charcoal is doubtful. A very elegant and convenient portable filter for soldiers, travelers, and others who may require to drink from turbid ponds and rivers, was constructed of Ransome's filtering stone, and is also made of the compressed carbon. A small cylinder of the stone or carbon is connected with a flexible India-rubber tube in such a manner that the cylinder may be immersed in a river, the mouth applied to a mouth-piece at the other end of the tube, and the water drawn through the filtering cylinder.

The filtration of water on a large scale will be treated of under WATER-SUPPLY.

Some very interesting experiments were made by Mr. H. M. Witt, to ascertain whether soluble matter, such as common salt, is in any degree removed from water by filtration. Theoretically, it has been assumed that this is impossible, since the filter only acts mechanically in stopping suspended particles; but the results of Mr. Witt's experiments show that from 5 to 15 per cent of the soluble salts were separated by sand-filters such as above described. This is a curious and interesting subject, well worthy of further investigation. Another most important matter, on which a series of accurate experiments is required, is to ascertain to what extent soluble organic matter may be decomposed by filtration, especially by charcoal filters, and to ascertain how long charcoal and other porous matter retains its property of acting on organic matter in watery solution. The power of dry charcoal in decomposing organic matter in a gaseous state is well established (see below), and it is also well known that fresh charcoal acts powerfully upon organic matter in solutions, but the extent to which this power is retained in the charcoal of a filter in continuous action has not been satisfactorily ascertained. This is of the highest importance, as it sometimes happens that water of brilliant transparency, and most pleasant to drink, on account of the carbonic acid it contains, is charged with such an amount of poisonous organic matter as to render its use as a daily beverage very dangerous. Charcoal obtained from burning bones is still more efficacious than charcoal from wood. A filter of animal charcoal will render London porter colorless. Loam and clay have similar properties. Prof. Way found that putrid urine and sewer water, when passed through clay, dropped from the filter colorless and inoffensive.

When a liquid contains mucilaginous or other matter having viscous properties, there is considerable difficulty in filtering it, as the pores of the medium become filled up and made water-tight. Special filters are therefore required for sirups, oils, etc. Such liquids as ale, beer, etc., would be exceedingly difficult to filter, and therefore they are clarified by the processes described under FINING. Oil is usually passed through long bags made of twilled cotton cloth (Canton flannel). These are commonly 4 to 8 ft. long, and 12 to 15 in. in diameter, and are inclosed in coarse canvas bags, 8 or 10 in. in diameter, and thus the inner filtering-bag is corrugated or creased, and a large surface in proportion to its size is thus presented. Sirups are filtered on a small scale by confectioners, etc., by passing them through conical flannel bags, and on a large scale in the *creased bag-filter* just described. Thick sirups have to be diluted or clarified with white of egg, to collect the sediment into masses, and then they may be filtered through a coarse cloth strainer. Vegetable juices generally require to be treated in this manner.

The simple laboratory filter has to be modified when strong acid or alkaline solutions, or substances which are decomposed by organic matter, require filtration. Pure silicious sand, a plug of asbestos, pounded glass, or clean charcoal, are used for this purpose. Böttger recommends gun-cotton as a filter for such purposes. He has used it for concentrated nitric acid, fuming sulphuric acid, chromic acid, permanganate of potash, and concentrated solutions of potash and aqua regia. He says that properly prepared gun-cotton is only attacked at ordinary temperatures by acetic ether.

Filtering paper for laboratory purposes requires to be freed from inorganic impuri-

ties that are soluble in acids, etc.; this is effected by washing the paper with hydrochloric acid, or, when thick, with nitric and hydrochloric acid, and removing the acid by washing thoroughly with distilled water.

When a considerable quantity of liquid has to pass through a filter, it is sometimes desirable that it should be made to feed itself. In the laboratory, this is done by inverting a flask filled with the liquid over the filtering funnel, the mouth of the flask just touching the surface of the liquid when at the desired height in the funnel. As soon as it sinks below this, air enters the flask, and some liquid falls into the funnel. On a large scale, self-acting filters are fed by the common contrivance of a ball-cock and supply-pipe.

Air-Filters.—The extraordinary powers of charcoal in disinfecting the gaseous products evolved from decomposing animal and vegetable matter, have been made available by Dr. Stenhouse in constructing an apparatus for purifying air that is made to pass through it. A suitable cage, containing charcoal in small fragments, is fitted to the opening from which the deleterious gases issue, and is found to render them perfectly inodorous, and probably innocuous. The first application of this was made in 1854, when a charcoal air-filter was fitted up in the justice-room of the mansion house, London, the window of which opens above a large urinal, the smell of which was very offensive in the room. The filter at once destroyed the nuisance, and the charcoal has been found to last many years without the need of renewal. 103 of such filters have been applied to the outlets of the sewers of one district of the city of London, and no bad smell is observable where they are placed, and no obstruction offered to the ventilation of the sewers. They have been applied with like results in two or three county towns. The subject is fully treated by Dr. Stenhouse in a letter to the lord mayor, published by Churchill (London). Charcoal respirators are small air-filters of the same kind applied to the mouth. See RESPIRATOR.

FILUM AQUÆ, the imaginary line along the middle of a stream which is the boundary of property on the opposing shores. Boundaries are usually specially defined, but in the absence of express terms the line between two nations, or states, or counties, or private farms, if it run along a stream, would be in the middle of such stream, and if an island should interpose the line would divide it to each party by a line corresponding to the course of the stream from the middle of the channel above to the middle of the channel below.

FIMBRIATED (Lat. *fimbria*, a border or hem), is said, in heraldry, of an ordinary having a narrow border or edging of another tincture.

FINA'LE, a t. of n. Italy, in the province of Modena, on the Panaro, 22 m. n.e. from Modena. It is surrounded by walls, has manufactures of linen and silk, and an active general trade. Pop. 4,500.

FINA'LE, the name given to that part of a musical composition which finishes the act of an opera; also to the last movement of an instrumental composition, as in the symphony, quartet, quintet, sonata, etc. The character of the finale, in purely instrumental works, is always lively. In the opera, it depends on the subject, while in some operas the finale consists of an aria alone, as in Mozart's *Figaro*, instead of the usual full concerted music for soli and chorus.

FINAL JUDGMENT. The meaning of this term in the law of Scotland having led to some dispute, an act of Sederunt (q.v.) was passed on the 11th July, 1828, declaring it to be applicable to a case in which "the whole merits of the cause have been disposed of, although no decision has been given as to expenses, or, if expenses have been found due, although they have not been modified or decerned for." The importance of the definition arises from the fact, that only final judgments can be carried by advocation from the inferior to the superior courts. "The whole merits of the cause" has been held to mean, not only the merits of the action to which the advocator is a party, but also those of any other conjoined with it. If the parties in the conjoined action will not proceed to have it determined, the advocator ought to apply to the inferior judge, stating his intention to advocate, and praying him to call on the parties to proceed with the conjoined process; and, failing their doing so, to disjoin the causes, which disjunction will render an advocation competent. Shand's *Practice*, i. p. 454. In advocations (q.v.) and suspensions (q.v.), if the record be closed, and the proof concluded in the inferior court, the case may be taken at once to the inner house without a judgment of the lord ordinary, 13 and 14 Vict. c. 36. In order to warrant an appeal to the circuit court in a civil cause (where otherwise competent) not only the merits must have been disposed of, but the expenses modified and decerned for.

FINANCE', a French word incorporated with our language, means the art of managing money matters, the person who professes this art being called a financier. Finance, in the plural, is often used for money itself, but still with a reference to the purpose to which it is to be applied, as where the finances of a country are said to have improved or fallen off—that is to say, have become abundant or scanty according to the expenditure of the country. Sometimes the word is applied to private wealth, but it is properly applicable to public funds. We use it in this country rather in a political and economic sense than officially, but in France there have been, from time to time, comp-

trollers-general of finance, councils of finance, bureaus of finance, etc. Many statesmen have been spoken of as great financiers, from the talent which they have shown for adjusting national revenue and expenditure, as Colbert, Turgot, and Necker in France, and Godolphin and Peel in Britain. As a branch of statesmanship, finance is intimately connected with other branches. In questions of national policy—such as, whether a state can go to war or not—the financier is the person who is expected to count the cost, and say how the necessary funds are to be obtained. In the question, whether an unpopular or oppressive tax is to be abolished, the financier is an authority on the question, whether the government can do without it. Hence, there is a special connection between finance and taxation, which has become closer and stronger since the progress of political economy has shown that the taxes which are the most productive, and even the most easily collected, are not always the best, looking at the gain or loss of a nation in the long-run. Turgot said that finance was the art of plucking the fowl without making it cry. On this notion, the principle of indirect taxation achieved its popularity. For instance, customs duties seem to fall on no one. The importer and the retailer add them to the price of the article, and the ultimate purchaser only knows that the article is dear without experiencing the sense of hardship felt by one who pays out money directly in the shape of a tax. But many indirect taxes have, on the other hand, been found to affect the trade and the wealth of communities to an extent which has made them very deleterious in comparison with direct taxes. See further on matters connected with finance the heads CUSTOMS; DEBT, NATIONAL; CORN LAWS; EXCISE; FREE TRADE; TAXATION; REVENUE.

FINBACK. See RORQUAL, *ante*.

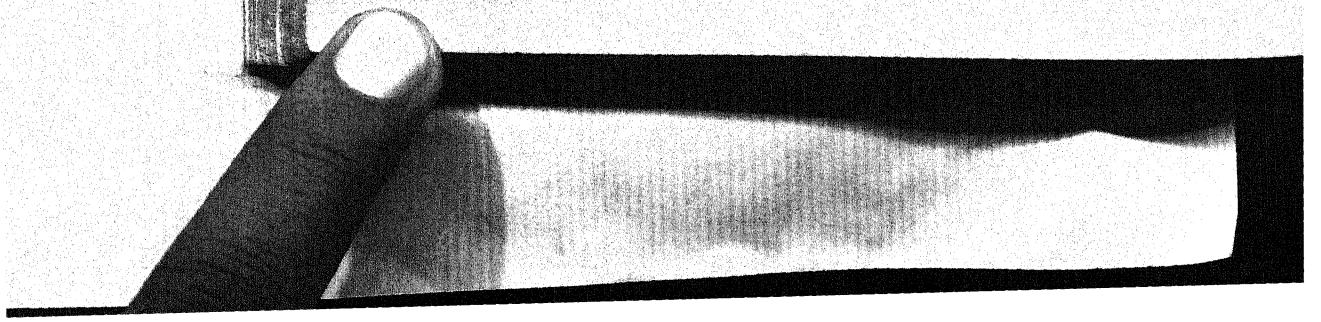
FINCH (Ger. *Fink;* for the origin of the word, see CHAFFINCH), the popular name of a great number of species of little birds of the order *insessores*, and tribe *conirostres*. Many of them have great powers of song, and are called *hard-billed song-birds*, in contradistinction to the warblers (*sylviadæ*) or *soft-billed song-birds*. The name F. is sometimes used as equivalent to *fringillidæ* (q.v.), either in its more extensive or more restricted application; but the limits of its popular use are very indeterminate, and some birds are equally known as finches and as linnets, or as grosbeaks, etc. The word F. often forms part of the popular name of birds of this family, as bull-finch, chaffinch, haw-finch, pine-finch, etc.

FINDER OF GOODS. The finder acquires a special property in goods, which is available to him against all the world except the true owner; but before appropriating them to his own use, he must use every reasonable means to discover the owner. It has been decided that if the property had not been designedly abandoned, and the finder knew who the owner was, or knew that he could have discovered him, he was guilty of larceny in keeping and appropriating the articles to his own use. *R. v.* Thurborn, 1 Denison, c.c. 393; Merry *v.* Green, 7 M. and W. 623. In the latter case, in which a person purchased, at a public auction, a bureau, in which he afterwares discovered, in a secret drawer a purse containing money, which he appropriated to his own use, Mr. Baron Parke thus laid down the law. "The old rule, that 'if one lose his goods, and another find them, though he convert them *animo furandi* to his own use, it is no larceny,' has undergone in more recent times some limitations. One is, that if the finder knows who the owner of the lost chattel is, or if, from any mark upon it, or the circumstances under which it is found, the owner could be reasonably ascertained, then the fraudulent conversion, *animo furandi*, constitutes a larceny." This law, however, although in most cases clear, is, in others, extremely difficult in application, and judges and juries often go wrong. The question for the jury is not whether they think the finder could have discovered the owner, but whether he believed that he could; and if not satisfied as to this, they cannot convict him of larceny. It is a mistake to suppose that the finder is bound to advertise, or use extraordinary means to discover the owner; indeed he cannot claim such expenses from the real owner, if he appear.

FINDHORN, a river rising on the w. side of the Monadh Liadh mountains, in the e. of Inverness-shire. It runs n.e. through the counties of Inverness, Nairn, and Elgin, in the valley of Strathdearn, passes Forres, and enters the Moray firth at the village of Findhorn by a lagoon three by one and a half miles in extent, after a course of about 90 miles. Its waters abound in salmon and trout. Its basin consists of gneiss in the upper part, and of old red sandstone in the lower. At one place, it rose nearly 50 ft. in the great floods of Aug., 1829, known as the "Moray floods," and did much damage. West of the mouth of the F. are the Culbin sands, in one part 118 ft. high, and covering 9,500 acres of a formerly fertile tract.

FINDLAY, seat of justice of Hancock co., Ohio, 46 m. s. of Toledo, on a fork of the Auglaize river, reached by the Lake Erie and Louisville railroad; pop. '70, 3,315. It does considerable manufacturing.

FINE OF LANDS, in England, fictitious proceedings formerly in common use in order to transfer or secure real property by a mode more efficacious than an ordinary conveyance. A fine is defined by Coke, quoting from Glanville, an amicable composition and final agreement by leave and license of the king or his justiciaries; and such indeed it was in its original effect, and it was called a fine because it put a termination



(*finis*) to all litigation between the parties, and those claiming through them, in regard to all matters touching the suit. The proceedings in a fine were shortly as follows: The party to whom the land was to be conveyed commenced a fictitious suit against the vendor. But the case was no sooner in court than the plaintiff asked leave to agree or settle with the defendant. This leave having been obtained, a covenant was entered into whereby the vendor or defendant, called the *cognizor*, recognized the right of the plaintiff, called the *cognizee*, to the lands, of which he admitted that the plaintiff was wrongfully kept from the possession. These proceedings, which at first were real, were afterwards adopted universally without having a shadow of foundation in fact. This solemn farce having been completed, a *note* of the fine, being an abstract of the covenant, the names of the parties, and the parcels of the land, was entered on the rolls of the court; and the business was concluded by what was called the *foot* of the fine, setting forth the parties, the time and place of agreement, and before whom the fine was levied. The whole was embodied in indentures commencing *hæc est finalis concordia*. It was necessary that a fine should be levied openly in the court of common pleas, or before the chief-justice of that court, or before two or more commissioners appointed in the country. Fines were of four kinds, which need not be specified here. In order that a fine should have full effect, it required to be levied with *proclamations*, i.e., open proclamation of the transaction in court. A fine so levied cut off the right even of strangers who fail to assert their claim during the period allowed by law; hence an estate was said to be barred by fine and non-claim. A fine levied by a married woman had the effect of cutting off all right she might have in the lands, and was the only mode by which a married woman could convey lands; and in order to protect her from undue influence, she was privately examined as to the voluntary nature of the transaction. A fine levied by tenant in tail cut off the estate tail, but did not affect remainders; hence, though a fine was sometimes used to bar an entail, the usual method was by common recovery (q.v.). But while a recovery was the most effectual method of barring an entail, it required the consent of the tenant in possession. Where, then, that consent could not be obtained, or where the tenant in tail was at the same time tenant in fee in remainder, a fine was a convenient mode of barring the entail. The statute *De Donis* prohibited fines as a means of barring entails, but this restriction was removed by 32 Hen. VIII. c. 36.

The old law as to fines has been abolished by the *Fines and Recoveries Act*, 3 and 4 Will. IV. c. 74. This act was passed for the purpose of abolishing the cumbrous machinery used in the transfer of land according to the ancient forms and fictions. The act abolishes all the fictions formerly in use. In regard to fines and recoveries by heirs of entail, it permits every tenant in tail of freehold land whether in possession, in remainder, or contingency, to dispose of the lands for an estate of fee-simple absolute, or any less estate, by any of the ordinary conveyances, except a will, at common law, or under the statute of uses (q.v.). The conveyance must be registered in the court of chancery within six months after its execution. But where there is an estate of freehold prior to the estate tail, the act requires that the consent of the tenant of the freehold shall be necessary in order to give full effect to the conveyance. This person is called the *protector of the settlement*. Where a conveyance is made without consent of the protector, it has the effect of barring those only who would succeed under the heir by whom it is executed. This is precisely the effect which under the old law belonged to a recovery without the consent of the tenant to the *præcipe*, and of a fine levied by a tenant in tail; so that the statute, while it abolishes the fictions, sustains entails as family settlements to the limited effect which they formerly possessed. In regard to fines by married women, the act provides that a feme coverte (q.v.) may dispose by deed of any lands, or of money subject to be invested in the purchase of lands. It is necessary, unless specially dispensed with by the court, that her husband should concur in the conveyance, and that she should acknowledge it before a judge of one of the superior courts at Westminster, or a master in chancery, or two of the commissioners appointed for that purpose under the act.

FINGAL, the name of the hero in the *Poems of Ossian*, written in the last century by James Macpherson, and based on the ancient traditions of the Gaelic people of Scotland and Ireland, some of which are still known among the Celtic people of the country. The *Finn*, or *Find*, of these old stories was the *Rig*, or king of the *Fians*, or *Fenians*, of Leinster, in the time of the monarch Cormac, son of Art, and he resided at a dun, or fort, at Almhain, now the hill of Allen, in the co. of Kildare, whence comes the name of the bog of Allen, given to the great central bogs of Ireland. *Find* is said to have been killed 283 A.D., at Ath Brea on the Boyne, by a fisherman who thought to become celebrated from the act. Some Norse antiquarians say that the terms *Fingal* and *Dubgal*, used by the early Irish, mean "fair" and "dark" stranger, "gal" signifying a foreigner, or invader; and that the "fair" were the Norwegian, and the "dark" the Danish pirates who ravaged Ireland about the close of the 8th century.

FINGAL'S CAVE. See STAFFA.

FINGER-BOARD, that part of a stringed musical instrument, as in the violin, violoncello, guitar, etc., which is made of ebony-wood, and glued on the neck of the instrument, and shaped on the top somewhat round, to suit the position in which the strings

lie on the nut and the bridge. At the lower end, the finger-board projects over the sounding-board of all those instruments played with the bow, while in the guitar species the finger-board is glued down on both neck and sounding-board. The strings are stretched along the finger-board from the nut at the top to the bridge at the lower end, and are pressed down by the fingers of the left hand, to make the different notes in music; while the right hand produces the sound either by a bow or the points of the fingers.

FINGERS. See HAND.

FINGERS-AND-TOES, the popular name of a disease in turnips, called also Anbury (q.v.).

FINIAL, an ornament, generally carved to resemble foliage, which forms the termination of pinnacles, gables, spires, and other portions of Gothic architecture. There are traces of foliated terminations, both in stone and metal, on the pediments of classic buildings (see ACROTERION), but it was not till the 12th c. that the F. proper was introduced. During the latter part of that c. and the whole of the 13th c., finials of the most perfect form and of infinite variety were used as the crowning ornaments of every salient point in the buildings of the period. The architects of the 14th c., in finials, as in other ornaments, imitated more closely the forms of natural foliage; but their finials had neither the variety of design nor the vigor of outline of those of the preceding century.

In the 15th and 16th centuries, the finials became more and more meager in form, and are frequently only four crockets set upon a bare pyramidal terminal. Some variety of effect is often obtained during this period by surmounting the F. with a gilded vane. This is common in Tudor and domestic architecture. Finials were carved both in stone and wood, and in the latter material with great delicacy and minuteness. In connection with metal-work, finials of metal were used, and whatever the material adopted, its natural capabilities were made a source of special beauty.

The F. is one of the most effective ornaments of Gothic architecture, and when that style was succeeded by the revival of classic, in the reign of queen Elizabeth, our forefathers could not persuade themselves to part with the finials to their buildings. We thus find in Elizabethan architecture a great variety of finials; they are, however, almost entirely of a geometric form, and without foliage, and are frequently, especially when terminating wooden gables, combinations of F. and vane partly wood and partly iron. In the stricter classic which succeeded the Elizabethan, some traces of the favorite F. still remain in the balls, obelisks, etc., used as terminations, and also in the shields and supporters (themselves a remnant of feudalism) which form the crowning ornament of gate-piers, pedestals, etc.

FINING, the process of clearing turbid liquors, such as beer, wine, etc. The simplest mode of F. is by passing the liquor through a porous substance that retains the solids and allows the clear liquid to pass through (see FILTER); but this method is only applicable to particles mechanically suspended in a limpid liquid. When the liquid contains mucilaginous or other matter, that readily clogs the filter, some other means of F. must be used. Such is the case with all malt liquors and most wines when turbid. When in good condition, these do not usually require F., as the suspended matter agglomerates, and sinks to the bottom shortly after the fermentation is completed. When this does not take place, some means of promoting such action are usually adopted. One of the simplest is to add soluble albumen, such as white of egg, to a portion of the liquid, and after beating it well in this, to add the mixture, and stir it into the whole of the liquid. Upon the application of heat, the albumen coagulates and contracts from its diffusion into a scum, enveloping and drawing together the suspended matter. The scum is then easily removed. This method is adopted for sirups and other liquids that may be heated without mischief. In making clear soups, the albumen of the meat performs this function. As alcohol coagulates albumen, it may be used for fining wines and cordials without the application of heat. It is generally used for red wines. Malt liquors are usually fined by means of gelatine, either isinglass or cheaper substitutes being used. One pound of isinglass is soaked in three or four pints of water, or sour beer, then more sour liquor added as the isinglass swells, until it amounts to about a gallon. The jelly thus formed is next dissolved in seven or eight gallons of the liquor to be fined. This solution, having the consistence of a sirup, is called "brewers' finings," and about a pint to a pint and a half is added to a barrel of ale or porter, or to a hogshead of cider or wine. The action of this depends upon the combination of the gelatine with the astringent matter (tannic acid) of the liquor, forming thereby an insoluble solid, which sinks to the bottom, and carries with it, like the coagulating albumen, the suspended matter; but as the flavor of malt liquors partly depends upon the astringents they contain, the F. affects the flavor; the astringents also help to preserve the liquor, and hence their removal is in this respect disadvantageous. Malt liquors thus fined do not "stand well on draught." The use of gelatine for F. red wines is objectional, as in most of these the astringent flavor is an esteemed quality, and therefore albumen is preferred.

Other methods of F. are adopted. Sugar of lead is sometimes added, and afterwards, one half its weight of sulphate of potash dissolved in water. By this means, an

insoluble sulphate of lead is precipitated, which in subsiding carries down other matters with it. This is a dangerous process, the salts of lead being poisonous. If properly conducted, the whole of the lead may be precipitated, but a casual mistake in the quantities might cause the death of many people. Ox-blood is used in the same manner as albumen and isinglass. Lime, alum, alcohol, and acids act by coagulating albumen, etc., contained in the liquor. Plaster of Paris, clay, and even sand, are sometimes used to carry down the suspended matters. A strip of isinglass or a piece of dried sole-skin is often used for F. coffee, and it acts in the manner above described. Liquors that are unusually difficult to fine are called "stubborn" by coopers and cellarmen.

FINISTÈRE, or FINISTERRE (Lat. *Finis terræ*, "land's end"), a department at the western extremity of France, comprehending a part of the former duchy of Bretagne, has an area of 2,648 sq.m., and a pop. (1876) of 666,106. It is traversed from e. to w. by two low but picturesque chains of hills. Its coast is very ragged and broken, its shores bristling with dangerous granite rocks, and fringed with many islands. The soil, one third of which is occupied by sandy tracts and marshes, is moderately productive; and, owing to the vicinity of the sea, which washes the northern, western, and southern shores of the department, the climate is mild and humid. Corn, hemp, and flax are grown in considerable quantities. In the valleys, smiling meadows everywhere occur. The silver and lead mines of F. are very valuable; those of Pouillaouen and Huelgoet being about the richest in France. Its principal rivers are the Aulne, the Elorn, and the Odet. The first of these is connected by a canal with the Blavet, and forms part of the great line of communication by water from Brest to Nantes. This department is divided into the following five arrondissements: Quimper, Brest, Châteaulin, Morlaix, and Quimperlé. Quimper is the chief town.

FINISTERRE, CAPE, or LAND'S END, is the name given to a promontory at the n.w. extremity of Spain, in lat. 42° 54′ n., and long. about 9° 20′ west. It is the *Promontorium Nerium* of the ancients.

FINLAND (Fin. *Suomesimaa*, land of lakes and marshes) is a grand duchy of Russia, lying between 59° and 70° n. lat., and between 21° and 33° e. long., is about 750 m. from n. to s., and has an average breadth of about 185 miles. According to the Russian census of 1851, the pop. was 1,636,915, and it has maintained a pretty constant rate of increase: in 1875 it was 1,912,647. The area of F. may be estimated at about 140,000 sq.m., of which nearly one third is occupied by marshes and lakes. The largest of these sheets of water, independently of lake Ladoga, which belongs partly to the Russian province of Olonetz, are lakes Puruvesi, Payane, Enara, and Saima; the last of these, which is about 180 m. in length, constitutes a portion of the system of water-communication which has been established between the central parts of the country and the gulf of Finland. The lakes are especially numerous in the s.w. of F., where they are almost all united together by rivers and waterfalls, round the central lake of Pyhäjärvi. The surface is a table-land, from 400 to 600 ft. above the level of the sea, with occasional higher elevations. There are, however, no mountain-ranges, and hence the rivers are unimportant; but in the n. the country is intersected by a sandy ridge known as the "Maanselkae," which merges, under the name of the Lapintunturit mountains, into the great Lappo-Norwegian Alpine chain. The coast-line is generally low, but to the s. it is skirted by numerous rocky islands, separated from the land by narrow channels, difficult of navigation, but well adapted for purposes of defense against hostile attacks from the sea. The principal geological formations are friable granite, hard limestone, and slate. The forests of F. are still very abundant, although they have been recklessly cut down in many parts of the country for the sake of their ashes, which are used to stimulate the soil, whose natural poverty requires to be counteracted by frequent manuring. Pine and fir predominate, but birch, beech, oak, etc., thrive in the s. parts of the country, where some good pasture-land is to be met with. Since the incorporation of F. with Russia, agriculture has declined, and fishing and cattle-breeding increased in importance. The exports from F. in 1873 amounted to 93,320,000 marks, equivalent to about £3,500,000. The most valuable are the products of the forests, as timber, pitch, potash, tar, and rosin; for the supply of grain is scarcely larger than the home demand, although at one time F. was regarded as the granary of Sweden for barley and rye. Few fruits ripen except hardy berries; and in the extreme n., vegetation is almost limited to mosses and liverworts. F. yields some copper, iron, lime, and slate; but it produces scarcely any salt, which constitutes one of the principal articles of import. Reindeer, wolves, elks, beavers, and various kinds of game abound; while the numerous lakes, and the adjacent gulfs, supply the inhabitants with an abundance of salmon, herring, and other fish. The climate is rigorous, and winter, which lasts seven or eight months, is succeeded by a brief spring, which passes almost suddenly into a short but hot summer of six or seven weeks, succeeded in its turn by a rainy season, which ushers in the return of cold weather. In the n., the sun is absent during a part of Dec. and Jan., and almost perpetually above the horizon during the short summer. F. is divided into eight lænes or governments—Nyland, Abo-Biorneborg, Tawastehuus, Wiborg, Kuopio, St. Michel, Wasa, Uleaborg, which are included in the 3 dioceses of Abo, Borgo, and Kuopio, and contain in all 214 parishes. The predominant form of religion is the Lutheran, but the Greek church has of late years been gaining ground.

The courts of law are held at Abo (the ancient capital), Wasa, and Wiborg; and there is one university, founded in 1640 at Abo, but removed to the present capital, Helsingfors, in 1829. The highest administrative authority is vested in the imperial senate for F., consisting of 18 members, nominated by the emperor, and presided over by the governor-general of Finland. The estimated revenue of F. in 1875 was 25,984,551 marks; the estimated expenditure was 25,791,153 marks. The army numbers now only 679 men, but has the privilege of serving in distinct corps, without being incorporated in the general forces of the empire. The naval force also forms a distinct squadron, under its own national flag.

The early history of F. is shrouded in obscurity, and little is known of the people before the 12th c., when Eric the saint, king of Sweden, exasperated by their piratical inroads, undertook a crusade against them, and compelled them, by force of arms, to profess Christianity. The hold which the Swedes then acquired over the country was never wholly lost till 1809, when Sweden secured peace with Russia by the cession of all F. and the island of Aland; before that time, however, the Russians had at various epochs wrested portions of the Finnish territories from the Swedes, while F. had been for centuries the perpetual cause and scene of wars between the two nations. The Swedish language had taken such deep root in F., that the efforts of the Russian government to displace it in favor of the native Finnish, have hitherto met with only partial success, and in many parts of the country, the people still openly prefer their old masters. The inhabitants, who call themselves *Suomes*, and are denominated *Tschudes* by the Russians, have, however, no affinity of race with the Swedes, and may be regarded as differing from all other European nations, excepting the Lapps and the Finmarkers, to whom they are very probably allied. See FINNS and FINNISH LITERATURE. For further information, see Gerschau, *Versuch einer Gesch. Finland* (1821); Stockfleth, *Bidrag til Kunds. om Finnerne i Norge;* Topelius, *Finland fremställdt i Teckning* (1860); *Zeitschrift der Gesellschaft für Erdkunde* (vol. vi., 1871).

FINLAND, GULF OF, the eastern arm of the Baltic sea, between 22° and 30° e. long., and between 59° and 61° n. lat. Its coasts are entirely Russian territory. It receives the waters of the great lakes Onega and Ladoga. The water of the gulf is not deep, and only very slightly salt. The topography of the gulf of F., which has been thoroughly elucidated by Struve, forms an interesting part of the great work of the Russian survey of the Baltic.

FINLAY, GEORGE, a distinguished historian, was b. in Scotland about the commencement of the present century. Circumstances induced him to take up his residence in Athens, where he patiently and industriously devoted himself to the study of the later Greek history. The fruits of his labor and researches are contained in his *History of Greece under the Romans*, 146 B.C. *to* 717 A.D. (London, 1843; 2d ed 1857); *History of Greece from its Conquest by the Crusaders to its Conquest by the Turks, and of the Empire of Trebizond*, 1204–1461 A.D. (London, 1851); *History of the Byzantine and Greek Empires*, 716–1453 A.D. (London, 2 vols. 1853–54); *History of Greece under the Othoman and Venetian Dominion* (1854); and *History of the Greek Revolution* (1861). F. is not regarded as a philosophical historian in the highest sense of the term; but, from his earnest endeavors to obtain an accurate conception of the times about which he wrote, he was enabled to throw a flood of new light on modern Greek history. F. also exhibited a profound knowledge of Greek art, antiquities, and topography. In 1870, he edited Brue's *Journal of Ali Pacha's Campaign in* 1715. He died in 1875.

FINLEY, JAMES BRADLEY, 1781–1856; b. N. C.; became a Methodist minister in Ohio in 1809, and in 1814 had charge of the Wyandotte Indian mission. He was for nearly half a century one of the most prominent preachers of his denomination, and was several times a delegate to the general conference. Among his published works are his *Autobiography;* the *Wyandotte Mission;* and *Sketches of Western Methodism.*

FINLEY, SAMUEL, D.D., 1715–66; a native of Ireland; arrived in the United States in 1734, and became a Presbyterian minister in Philadelphia in 1740. For preaching in Connecticut in violation of a law which prohibited any person from preaching in the parishes of settled ministers without their consent, he was arrested as a vagrant and put out of the colony. In 1744, he was pastor and teacher of an academy in Maryland; in 1761, president of the college of New Jersey. His sermons have been published.

FINMARK, a province of Norway, and the most northern part of the continent of Europe, lying between 68° 30′ and 71° n. lat., and 17° and 31° e. long., constitutes Norwegian Lapland (q.v.). Area about 20,000 sq.m., of which three fourths are occupied by the continent, the rest belonging to the numerous islands which skirt its n.w. shores, and terminate in the North cape. Innumerable fiords and bays indent the coast. The interior is intersected by a snow-covered range of mountains, reaching an elevation of 4,000 ft.; the line of perpetual snow being here less than 3,000 ft. above the level of the sea. Agriculture is impracticable above an elevation of 100 ft.; a few berries are the only fruits that ripen; and although barley, potatoes, and a few other vegetables thrive in some parts, fish and game constitute almost the sole food of the inhabitants. In the n., where no trees are to be found, the turf of the marshes affords a good supply of fuel. The thin vegetable mold which covers the stony soil yields grass for the

sheep and cows, which graze on the declivities of the rocks skirting the fiords and creeks. The principal source of wealth is the reindeer in the n., and the cod-fisheries in the south. The population, which in 1875 numbered 24,071, consists principally of Lapps (see LAPLAND), a people of Finnish origin. Hammerfest, the capital of F. (70° 40′ n. lat.), is the most northern town of Europe.

FINN, HENRY J., 1788–1840; a native of cape Breton, who became a comedy actor in England, and appeared in many theaters in the United States, where he gained great popularity. He was one of the passengers lost in the burning of the steamboat *Lexington* on Long Island sound, Jan. 13, 1840.

FINNEY, CHARLES G., D.D., 1792–1875; born in Warren, Ct.; removed in childhood to Oneida co., N. Y. Having had the advantages of a common school, as a pupil until his 16th year, and as a teacher until he was 20, he then went to a high-school in New England and studied there for some time, instead of entering college as he had wished to do. At a later period still, he acquired some knowledge of Latin, Hebrew, and Greek. In 1818, he commenced the study of law at Adams, Jefferson co., N. Y. At that time he was ignorant of religion, but finding references to the Bible in his law-books, he procured one, and, beginning the examination of it in its bearings on points of law, became increasingly interested in it, and formed the habit of interpreting it as judges in court interpreted written laws. The theological views of the pastor of the church which he attended he describes as Calvinistic in a very high degree. Every position which the minister took, either in preaching or conversation, the law-student was accustomed to judge by the Bible, and to discuss with its author in very free and earnest yet friendly debate. He became deeply interested in religion, as a matter of personal importance, and was convinced that if the soul be immortal, he required a great inward change in order to be prepared for heaven. Satisfied by his own examination that the Bible is the true word of God, and brought face to face with the question whether to follow Christ or to pursue a worldly life, he did not delay his choice. Giving up the profession of law, of which he was becoming passionately fond, he determined to preach the Gospel as his life-work. His personal experience at that time was very remarkable. He received, after he believed, a baptism of the Holy Ghost which compelled him, in the abundance of his joy, to cry out when alone with God, that he could not live if the manifestation were not stayed. Beginning at once to preach in the social meetings of the church and in private conversation, he found very decided instances of conversion multiplying around him. After his licensure to preach, those revivals of religion at once began under his ministry which continued to be its great characteristic until its close. The doctrines he preached were "the voluntary total moral depravity of the unregenerate, the unalterable necessity of a radical change of heart by the Holy Ghost and by means of the truth, the divinity of the Lord Jesus Christ, his divine mission, perfect life, vicarious death (as an atonement for the sins of all mankind), and his resurrection; repentance, faith, justification by faith, and the doctrines kindred with these. The means used were simply preaching; much prayer, public and private, as an indispensable condition of promoting the work; conference among Christians; meetings to instruct earnest inquirers, and personal conversation." It had been, he says, "the common practice to set anxious persons to praying for a new heart, and to using means for their own conversion. This had produced in them the impression that they were willing to be Christians, and were taking pains to induce God to convert them. But I tried to make them understand that God was using the means with them, and not they with him; that he was willing and they were not; that he was ready and they were not; that he required present submission to his will and present acceptance of Christ; that all delay was only an evasion of present duty; that in praying for a new heart they were trying to throw the responsibility of their conversion on God; and that their efforts to do duty while they did not give their hearts to him were hypocritical and delusive." Under this style of preaching and of earnest efforts, revivals, resulting in the hopeful conversion of thousands, were witnessed at Evan's Mills, Antwerp, Gouverneur, De Kalb, Western, Rome, Utica, Auburn, Troy, Rochester, Buffalo, in the state of New York; at Wilmington, Del.; Philadelphia, Reading, Pa.; New York, Boston, Hartford, London, Edinburgh, Oberlin, O.; and many other places during a period of 50 years. In many of the places named the revivals were repeated, in different years, again and again. In London, it was estimated that on some occasions when he preached as many as 50,000 persons left their homes to attend the services; though, of course, the building could contain but a small portion of the number. In 1835, the college and theological seminary at Oberlin, O., were founded, with Mr. Finney as professor of theology and pastor of the college church. Arthur Tappan, of New York, at that time pledged his income of $100,000 per annum (except what was needed for the support of his own family) to the institution until it should be beyond pecuniary want. After 1860, Mr. Finney's strength being no longer equal to the extra labor abroad, he continued to work at home with great energy and success. In 1872, he resigned the pastoral office at Oberlin, but persevered in his labors in the seminary, where, having completed his last course of lectures in July, 1875, he died on a quiet Sunday in the following month, being within two weeks of 83 years of age. During 55 of these years his life had been a power in the

land. His most important published works are: *Guide to the Saviour; Lectures to Professing Christians; Lectures on Revivals of Religion; Sermons on Important Subjects; Systematic Theology;* and an *Autobiography*, written at the urgent solicitation of his friends, and published after his death.

FINNISH LANGUAGE AND LITERATURE. The Finnish language is used by the people known as Finns, inhabiting Finland, or dispersed throughout Lapland, the Baltic provinces, parts of Russia proper, both banks of the middle Volga, through Perm, Vologda, West Siberia, and Hungary, and constituting the western branch of the great Urato-Altaic family. There are five groups: 1. The Finns proper; 2. The Lapps; 3. The Peruvian Finns; 4. Volga Finns; 5. Ugrian Finns. 1. The first group comprises the Suomi or Suomelaisset, i.e., Finn men, who occupy nearly all Finland except a portion on the gulf of Bothnia, where Swedish is spoken; next, the Karelians, who extend from Russian Lapland s. to the gulf of Finland and lake Ladoga, and e. to the White sea and the shores of lake Onega; thirdly, the Chudic, a Slav term often applied to the whole group, but now restricted to the Veps, or northern Chud, and the Voltic or southern Chud, dwelling in scattered communities on the shores of lake Onega; and lastly, the Baltic Finns, including the Esthe or Esthonian, occupying the greater part of the southern coast of the gulf of Finland and the northern half of Livonia, and the Livonian or Krevinian, occupying a small corner in the n.w. of Courland. 2. The Lapps occupy the extreme n.w. of Russia, and some parts of northern Sweden and Norway. 3. The Permian Finns comprise the Siryenians, occupying an extensive region between 60° n. and the Arctic circle, and 50° e. and the Ural mountains, but mainly in the section of the government of Vologda; the Permian proper, formerly diffused throughout Perm, Vialka, Oufa, etc., now surviving in isolated communities mainly about the upper Kama; and the Votyak, occupying a relatively compact territory in Viatka as far n. as Glazov on the river Tchepsa. 4. The Volga Finns include the Cherremissian on the left bank of the Volga, from a little w. of Kasan to near Nijni-Novgorod; and the Nordivinian, divided into small communities on both banks of the Volga, about Simbirsk, Samara, Stavropot, and Tambar. 5. The Ugrian Finns include the Voguls, extending from the Ural mountains e. to near the river Obi, and s. to Tobolsk; the Ostyaks, from the Voguls e. to the river Yenissei, between Turuchausk and Yenisseisk, and from the Arctic circle to 59° n.; and the Magyars of Hungary. These five groups form one linguistic family, to which Samoyede is related. The richest and most highly cultivated languages of the family are the Suomi and Magyar. The dialects are all distinctly agglutinative forms of speech, with decided tendencies towards true inflection, so much so that in many grammatical endings the essential difference between agglutination and inflection becomes obscured. As in other Urato-Altaic tongues, progressive vowel-harmony forms a characteristic feature of the Finnish group. Rask considered the Finnish language the most sonorous and harmonious of tongues. It is maintained by some that the Finnish languages represent the oldest forms among the Urato-Altaic groups. There is strong evidence that the Finns, or a closely allied race, must have at one time, probably prehistoric, been spread over a considerable area of central, if not of western Europe. The Finnish language is spoken by over 2,000,000 people, and in three different dialects, viz., the East Finnish or Karelian, the South Finnish, and the West Finnish. The first of these is the oldest and least developed; the second is the main vehicle of Finnish literature. It is emphatically vocalic. It has five fundamental vowels—a, e, i, o, and u—and employs 12 diphthongs. The grammatical relations between the several parts of speech are expressed exclusively by suffixes. Nouns are used without any article; have no gender; and are declined, both in singular and plural, through 15 different cases, so as to express the relations which in the Indo-Germanic languages are sometimes indicated by prepositions. Verbs have but two tenses, present and past, the future tense being expressed by a circumlocution; but their conjugation is very intricate. The language is capable of expressing the nicest shades of meaning.

The chief monument of Finnish literature is the *Kalewala*, a sort of epic poem, which, until the present century, existed only in the memory and on the lips of the peasantry. A collection of some of the scattered parts of this poem was published in 1822 by Zacharias Topelius, but Elias Lönnrot, 13 years later, published a far more complete collection. Dr. Lönnrot wandered from place to place among the peasantry, living with them and taking down from their lips all that they knew of their popular songs. After unwearied diligence in his researches, he was successful in collecting 12,000 lines, which he arranged into 32 runes or cantos, and published exactly as he heard them sung or chanted. Continuing his researches, he published in 1849 a new edition of 22,793 verses, in 50 runes. The importance of this long-hidden epic was at once recognized in Europe, and translations of it were made in several languages. Some specimens of it were translated into English by prof. Porter, of Yale, and published in New York in 1868. The poem is written in eight-syllabled trochaic verse, and an idea of its style may be obtained from Longfellow's *Hiawatha*, which approaches a true imitation of the Finnish epic. Prof. Max Müller bears emphatic testimony to the merits of this ancient poem. "It is," he says, "equal to the *Iliad* in length and completeness; nay—if we can forget for a moment all that *we* in our youth learned to call

beautiful—not less beautiful. *Kalewala* will claim its place as the fifth national epic of the world, side by side with the Ionian songs, with the *Mahábhárta*, the *Shahnámeh*, and the *Nibelunge*." The *Kalewala* is concerned entirely with the mythology or folk-lore of the people. In the story there is a certain unity of plot, though the various parts are not perfectly homogeneous, and appear to be the product of different minds at different periods, the various songs having evidently received additions in course of time. They probably originated before the Finns were converted to Christianity, and when they were not scattered as they are now. When Dr. Lönnrot collected the *Kalewala* songs, he also gathered a considerable quantity of lyric poetry, which he published under the name of *Kanteletar*, from the name of the national instrument to which they are sung—a species of harp with five strings. Of recent Finnish poets, the most popular seems to be Paavo Korrhoinen, a peasant, a very sarcastic writer. Other modern poets are Marteska, Kettunen, Ilhainen, Oksaselta. The Finns abound in proverbs, Lönnrot having published a collection of upwards of 7,000, with about 200 charades, while considerable collections of legends and tales have been published. The first printed book in Finnish was probably the *Abecedarium* of Michael Agricola, bishop of Abo, which appeared in the middle of the 16th century. A translation of the New Testament by the same bishop appeared in 1548, at Stockholm. The whole Bible was not translated into Finnish till 1642. During the last and present centuries there has been considerable literary activity in Finland, and books in almost every branch of research are found in the language, mainly translations or adaptations. At the Paris international exhibition of 1878, several native Finnish painters and sculptors exhibited works which would do credit to any country. Finland is rich in periodicals of all kinds, the publications of the Finnish societies of literature and of the sciences and other learned bodies being specially valuable. Works on Finnish history and geography are quite numerous. In language we have Lönnrot's great Finnish-Swedish dictionary, recently published by the Finnish literary society.

FINNISH LITERATURE. To Elias Lönnrot of Helsingfors belongs the merit of having rescued from utter oblivion some of the numerous sagas and songs which had for ages been recited by the Finnish *runolainen*, or singers, to the sound of the *kantela*, or harp, and thus transmitted from one generation to another. Although his researches were limited to the district of Karelia, in the government of Kupio, he obtained numerous songs and proverbs, and a complete epos, consisting of 32 parts, each of which contained from 200 to 700 verses. This singular monument of the earlier culture of the people was published by him in 1835, under the title of *Kalewala* (the ancient name of Finland), but it met with little notice till the academy of Dorpat made it the subject of discussion at their meetings in 1840. This publicity soon attracted the attention of foreign philologists, and led to its translation into Russian, Swedish, and German. The learned Finnish scholar, Carsten, the Grimms, and Brockhaus, agree in regarding the *Kalewala* as a pure epic, and characterize it as a composition possessing a thoroughly oriental appreciation of nature, an almost unparalleled wealth of images and tropes, great flexibility of rhythm, and a copiousness of synonyms not to be met with in any other northern tongue. There is less unanimity in regard to the character of the plot, for while one critic believes that the incidents refer to definite historical epochs, another regards them as purely allegorical. But whatever discrepancy of opinion there may be in this respect, the *Kalewala* is admitted by all who are entitled to form a judgment of its merits, to be one of the most curious monuments of the kind possessed by any European people. The date of its composition must be referred to a period anterior to the introduction of Christianity amongst the Finns in the 14th c., while there is even strong internal evidence, from an identity of the names and traditions of the *Kalewala* with many still current in Esthonia, that the poems very probably belong to an epoch anterior to the immigrations of the Karelians into the districts which they now occupy. The publication of the *Kalewala* has given a powerful impetus to the study of the Finnish language, which the Russian government effectively sustains by encouraging the cultivation and use of their native tongue by the Finlanders. The upper classes still cling to the use of Swedish, but the peasantry and small landed proprietors welcome with avidity every addition to the limited stock of their printed literature. Finnish weekly papers circulate freely among them, and political questions are discussed with an enthusiasm which is never met with among similar classes in Scandinavia or Russia proper, but which affords additional proof of the diversity of character which distinguishes the Finn from either of the neighboring nations with which he has been successively incorporated.

The prose literature of Finland is almost exclusively devoted to religious and moral subjects. The Bible was translated into Finnish in 1642, but a part of the Old Testament had been translated a century earlier. Several Finnish poets have acquired a reputation of late years, but their works breathe the same melancholy tone which so strongly characterizes the more ancient poems of Finland. Lönnrot has made a collection of about 7,000 proverbs (*Suomen kansan Sanalskuja*, 1842), and about 2,000 charades (*Suom. kans. arwoituskia*, 1851). See Erman's *Archiv f. d. Kunde v. Russland. Tengström i Fosterländskt Alb.* (Helsingf.).

FINNS, geographically, the name of the inhabitants of Finland; but in ethnology, that of a considerable branch of the Ugrian race, dwelling for the most part in Finland,

though with some representatives in Sweden and Norway as well. The Ugrians have been classed among the nations said to have a Mongolian origin. Dr. Latham places them among the "Turanian Altaic Mongolidæ," and divides them into Ugrians of the east, and Ugrians of the west. The western Ugrians consist of Lapps, Finns, Permians, and other nations or tribes in the n. and n.w. of Russia, and of the Magyars in Hungary. The Magyars are the most numerous, and next after these come the F., comprising about 2,000,000 of individuals. All the other tribes of western Ugrians do not together comprise so many. The F., in common with the other Ugrians, are of the Mongolian type. A recent traveler, Mr. Bayard Taylor, describes them as having "high cheek-bones, square, strong jaws, full, yet firm lips, low broad foreheads, dark eyes and hair, and a deeper, warmer red on the cheeks than on those of the rosy Swedes. The average height is, perhaps, not quite equal to that of the latter race, but in physical vigor there is no inferiority, and there are among them many men of splendid stature, strength, and proportion.". Other travelers bear similar testimony to the physical appearance of the F. proper, or those of pure Finnish blood; but although these form the majority, there are many, in the towns especially, who pass for F., while, in reality, they are quite as much entitled to be called Swedes, or even Russians, on account of the frequent intermarriages of the F. with individuals of those two nations. The F., from having been originally a nomadic race, have for many centuries been stationary and civilized. Long before the arrival of the German and Slavic nations in the n. of Europe, the Ugrians, or *Ogres* (for the name so common in fiction is really of historic origin), possessed it, and were gradually pushed further n. and e. by the new invaders. Both F. and Lapps, there is good reason to believe, originally extended much further s. than they do at present, occupying, perhaps, the whole of Sweden and Norway. "The Finns," says Prichard, "were, in the time of Tacitus, as savage as the Lapps; but the former, during the succeeding ages, became so far civilized as to exchange a nomadic life for one of agricultural pursuits; while the Lapps have ever continued to be barbarous nomades, as well as the Siberian tribes of the same race—namely, the Woguls and Ostiaks. The Finns, as well as their brethren the Beormahs, or Finns of the White sea, had probably undergone this change long before the time when they were visited by Otther, the guest of Alfred. When the Finns were conquered by the Swedes, they had long been a settled people, but one of curious, and singular, and isolated character."

The Finnish *language*, like that of the other Ugrian nations, belongs to the Turanian family of languages, and hence offers some striking points of resemblance to the languages and dialects of the Turks, Tartars, Mongols, Mandshurians, Tungusians, and even Magyars or Hungarians. In Finnish, the nouns are not inflected, but an additional word is required to denote the variations of case, number, and sex. The prepositions and pronouns are suffixed to the words they modify. The verbs have only two tenses, past and present; the future being expressed by adding to the present some word indicating a future action or state of being. Rask considers the Finnish to be the most harmonious of tongues. Many Swedish, and a few Russian words have, of course, become incorporated with the language, in consequence of the social and political relations of the F. with those two countries. The F. of our time are doubtless the same race as the *Fenni* of Tacitus, and the *Phinnoi* of Strabo and Ptolemy, though not occupying the same geographical area. "The nearest approach to a name at once general and native," says Dr. Latham, "is Suomelainen, meaning swamp, morass, or fen people; the term Finn and Finlander being of foreign origin." With respect to the social habits, morals, and manners of the F., all travelers are unanimous in praising them. They are of a cheerful disposition, affectionate towards each other, and honest and honorable in their dealings with strangers. They are also cleanly in their persons, being much addicted to the use of the vapor-bath, to which circumstance may be attributed the strongly marked difference in physical appearance between them and the stunted Lapps, to whom, in language as well as many other respects, they stand closely related.

FINS (allied to Lat. *pinna* or *penna*, see letter F), organs adapted for swimming or locomotion in water. The limits of the application of the term are rather vague. It is always applied to the locomotive organs of fishes, when they possess special organs of locomotion, as almost all of them do; and equally to those organs (the pectoral and ventral fins) which are homologous to the limbs of other vertebrate animals, and to those (the vertical fins) which may be said to be superadded to them, and to belong to fishes alone; equally also to those which are furnished with rays, having a membrane stretched on them, as is generally the case in all the F. of fishes, and to those which consist, as in some fishes, of a mere fold of the skin, and which, when they exist in fishes, are in reality not very much organs of locomotion. The name F. is given to the locomotive organs of *cetacea*, but not to those of any other *mammalia*, even when, as in the case of the hind-feet of seals, they approach very nearly to the character of the F. of fishes. Nor is it ever given to the webbed feet of birds. But it is often given to the swimming organs of invertebrate animals, as to the expansions of the mantle which serve this purpose in the *cephalopoda*, and which are entirely destitute of rays.

FINSBURY, or FEN TOWN, a parliamentary borough of Middlesex, forming the n. part of London (q.v.).

FINSCALE. See RED-EYE.

FIN'STERAAR'HORN, the highest peak of the Bernese Alps. See ALPS.

FINSTERWALDE, a small t. of Prussia, in the province of Brandenburg, is situated on an affluent of the Black Elster, 40 m. n. of Dresden. It has manufactures of cloth and machinery; spinning and weaving are carried on. Pop. '75, 6,919.

FIOREL'LI, GIUSEPPE, b. 1823; an Italian archæologist, one of the directors, and more recently the chief superintendent, of the excavations at Pompeii. He has published maps of the old city, and a chronological history of the progress of discovery. He is also the editor of a journal containing a daily record of the work.

FIORENZUOLA (*Florentiola*), a t. of northern Italy, in the province of Piacenza, 22 m. w.n.w. from Parma, on the Arda, in a beautiful and fertile plain. It is a station on the railway between Parma and Piacenza, and is also on the ancient Æmilian way. It is well built, and a place of considerable activity. It formerly had numerous conventual and other ecclesiastical establishments. The principal church is still collegiate, and contains some curious relics of ancient art. There are some interesting relics of mediæval times in Fiorenzuola. It is supposed to occupy the site of the ancient *Fidentia*. Pop. 6,500.

FI'ORIN. See BENT GRASS.

FIR, a name often used in a sense coextensive with the widest sense of the word Pine (q.v.), and therefore so as to include a large portion of the Coniferæ (q.v.), or at least the whole of the Linnæan genus *pinus*. But the name F. is often also used in a more restricted signification, and the trees so designated are those forming the genus *abies* of some authors, *abies* and *picea* of others, which the greater number of botanists have now agreed in separating from *pinus*. The SCOTCH FIR, however, is a true pine (*pinus sylvestris*), and will be described along with its congeners. See PINE.—The genus *abies* is distinguished from *pinus* by the flat rounded apex of the scales of its cones, and by leaves not in clusters of definite number. Some botanists include the species of larch (q.v.) and cedar (q.v.) in the genus *abies;* but if these be separated, no species with clustered leaves remain in this genus, which then contains only the different kinds of SPRUCE FIR and of SILVER FIR, or species most nearly allied to those which ordinarily bear these names. All of them are evergreen. The spruce firs form the genus *abies* of some authors, distinguished by short solitary leaves, scattered all round the branchlets, and by the scales of the (pendulous) cones being attenuated at the apex, and remaining fixed to the axis of the cone. The silver firs form the genus *picea* of some, distinguished by the deciduous scales of the (erect) cones. It being supposed, however, that the Linnæan names had been given through mistake, and that the common silver fir is the true *abies* of the ancients, and the Norway spruce their *picea*, Link has attempted, but without being followed by many, to restore these names to their ancient use, and to denominate the genera accordingly. The NORWAY SPRUCE (*abies excelsa* or *pinus abies*) is a noble tree, sometimes attaining the height of 180 ft., with long cylindrical pendulous cones, denticulate scales, and scattered, green, crowded, suddenly pointed, almost quadrangular leaves. It is the *Fichte* of the Germans, called also *Rothtanne* or *Schwarztanne*. Like the other kinds both of spruce and silver fir, it exhibits the peculiar character of the *coniferæ* more perfectly than many of the true pines do, in its perfectly erect stem, from which proceed almost whorled horizontal branches. It is a very beautiful pyramidal tree, and when old, its long branches droop towards the ground. It forms entire forests in the middle and n. of Europe and in Asia, chiefly upon elevated ridges, although it prefers moist places. It loves districts of primitive rock. In some places, it is found even within the arctic circle. It is not a native of Britain, but has long been very generally planted, although too often it is merely made a nurse for other trees, and is not allowed to attain a considerable age or size. It is of rapid growth, but is believed to live to the age of 400 years. It yields the same products as the Scotch fir, resin, turpentine, tar, and lampblack (see these heads): but more resin than turpentine. The true spruce resin flows spontaneously from the bark. The purest pieces are whitish or pale yellow, are sold under the name of common FRANKINCENSE, and used for ointments and plasters, and when melted yield the common Burgundy pitch (q.v.). The bark of the spruce is a good and cheap non-conductor of heat; the cones are an excellent substitute for tanners' bark. In Sweden and Norway, the inner bark is made into baskets; and the long and slender roots, split and boiled with alkali and sea-salt, are dried, and twisted into cordage, which is used both for vessels and by farmers. The wood is used for fuel and for house-building; it also supplies masts and spars for ships. It is the WHITE CHRISTIANIA DEAL and DANZIG DEAL of the market, and is very largely imported into Britain from Norway and the Baltic. It is whiter, lighter, less resinous, and more elastic than the timber of Scotch fir. The sapwood, whilst still in a gelatinous state, is sweet, and is eaten fresh in Sweden and Lapland; and the inner bark, in times of scarcity, is mixed with a little flour or meal of some kind, and baked into bread. The young shoots, still covered with their bud-scales, are in many parts of Europe used for fumigation. The leaf-buds are also employed medicinally in cases of scurvy, rheumatism, and gout. The pollen is often sold by apothecaries instead of the dust of the clubmoss or *Lycopodium*.—A very superior

variety of this F. is known as the RED NORWAY SPRUCE. Dwarf varieties are cultivated amongst ornamental shrubs.—The BLACK SPRUCE (*Abies nigra*), of which the RED SPRUCE (sometimes called *A. rubra*) is regarded as a mere variety caused by difference of soil, and the WHITE SPRUCE (*A. alba*), form great woods in North America. The black spruce is found as far n. as lat. 65°. Both species are now common in plantations in Britain. Both have quadrangular leaves; those of the black spruce are of a dark glaucous green, those of the white spruce are of a lighter color. The cones of the black spruce are short, ovate-oblong, obtuse, and pendulous, with rounded scales ragged at the edge; those of the white spruce are oval, and tapering to a point with entire scales. The black spruce is a valuable timber tree, supplying yards of ships, etc., but its planks are apt to split. The white spruce is smaller, and the timber inferior. From the black spruce the *essence of spruce* is obtained, which is so useful as an antiscorbutic in long voyages, and is used for making spruce-beer. Spruce-beer is also made by adding molasses or maple sugar to a decoction of the young branchlets, and allowing the whole to ferment. From the fibres of the root of the white spruce, macerated in water, the Canadians prepare the thread with which they sew their birch-bark canoes; and the seams are made water-tight with its resin.—From the twigs of the ORIENTAL FIR (*A. Orientalis*), a native of the Levant, a very fine clear resin exudes, which is known by the name of SAPINDUS' TEARS. This F. has a very short quadrangular leaves, densely crowded, and uniformly imbricated.—The HEMLOCK SPRUCE of North America (*A. Canadensis*) forms great part of the forests of Canada and of the northern states of America, extending northwards as far as Hudson's bay. Its timber is not much esteemed, as it splits very obliquely, and decays rapidly in the atmosphere; but the bark is valued for tanning. The leaves are two-rowed, flat, and obtuse. The cones are scarcely longer than the leaves. The young trees have a very graceful appearance, but the older ones are generally much disfigured by remaining stumps of their lower branches.—*A. dumosa* of Nepal is very much allied to the hemlock spruce.—*A. Douglasii* is a noble tree, attaining a height of 250 ft., which forms immense forests in the n.w. of America, from lat. 43° to lat. 52°. The bark, when the tree is old, is rugged, and 6 to 9 in. thick. It abounds in a clear, yellow resin. The timber is heavy, firm, and valuable; the growth very rapid.—*A. Menziesii*, a native of North California, very similar to *A. Douglasii* in general appearance, also produces timber of excellent quality.—*A. brunoniana*, a Himalayan species, forms a stately blunt pyramid of 120 to 150 ft. in height, with branches spreading like the cedar, and drooping gracefully on all sides. It is found only at considerable elevations. The wood is not durable, but the bark is very useful.—The KHUTROW or HIMALAYAN SPRUCE (*A. Smithiana*, called also *A. morinda* and *A. khutrow*) much resembles the Norway spruce, but has longer and more pendulous branches. The wood is white, and not highly esteemed, although it readily splits into planks.—The MOUNT ENOS FIR (*A. Cephalonica*), a native of Cephalonia, attaining a height of 60 ft., and a diameter of three ft., yields durable and very valuable timber.—All these species have been introduced into Britain, and some of them seem likely soon to be pretty common in our plantations, as well as others from the n.w. of America and from the mountains of Asia, as *A. Wittmanniana*, etc., noble trees, and apparently quite suitable to the climate.—The common SILVER FIR (*Picea pectinata*, or *abies* or *pinus picea*) has erect cylindrical cones, 5 to 6 in. long, and two-rowed leaves, with two white lines upon the under side. It forms considerable woods upon the mountains of central Europe and of the n. of Asia, and attains a height of 150 to 180 ft., and an age of 300 years. It is not a native of Britain, but large trees are now to be seen in very many places. The wood is white, contains little resin, is very soft and light, and is employed for the ordinary purposes of coopers, turners, and joiners, and in ship and house carpentry, also for making band-boxes and for many fine purposes, especially for the sounding-boards of musical instruments. The same resinous and oily products are obtained from the silver F. as from the spruce and Scotch F. but of superior quality. It yields the beautiful clear turpentine known as Strasburg turpentine. Very similar to the silver F., but generally of much smaller size, and indeed seldom much above 30 ft. in height, is the BALM OF GILEAD FIR (*Picea* or *abies balsamea*), a native of North America from Virginia to Canada. The wood is of little value, but the tree yields Canada balsam (q.v.). Besides these, a number of other species of *picea* are found in the western parts of North America and in the Himalaya, some of which are trees of great magnitude, and yielding excellent timber, as *P. grandis*, a California tree of 170 to 200 ft. in height—*P. amabilis*, a species much resembling it—*P. nobilis*, a majestic tree, which forms vast forests on the mountains of northern California—*P. bracteata*, a Californian species remarkable for its slender stem, which rises to a height of 120 ft., and yet is only about one foot in diameter at the base, and likewise for the manner in which the middle lobe of each bractea of its cones is produced so as to resemble a leaf—*P. Webbiana*, the HIMALAYAN SILVER FIR, which in its native regions, fills the upper parts of mountain valleys, and crowns summits and ridges at an elevation of upwards of 10,000 ft., a tree of great size, 35 ft. in girth, and with a trunk rising 40 ft. before it sends out a branch. Most of these have been introduced into Britain with good prospect of their succeeding well in our climate, and other species, as *P. pichta*, a native of the Altai mountains, very nearly resembling the silver F., *P. nordmanniana*, *P. Fraserii*, etc.—*P. religiosa* is a tall and elegant tree, a native of the mountains of Mexico, with

slender branches, which are very much used by the Mexicans for adorning churches, and cones shorter than those of any other silver fir. *P. jezoensis* is a new species introduced from Japan.

FIRBOLGS, the name given in the fabulous early history of Ireland to a tribe said to have descended from the Nemedians, who, under their leader Nemedius, landed in the island about 2260 B.C.; and after 217 years, left it, on account of the oppression to which they were subjected by pirates called the Fomorians. The emigrating Nemedians formed three bands—one went to Thrace, and from them descended the F.; a second to the n. of Europe or Lochlan, from whom descended the Tuatha de Danann; and the third to Alban or Scotland, from whom sprung the Britons. The F. returned to Ireland in three tribes, one of which more especially bore the name Firbolg; the others were called Firdomnan, and Firgailian. The three tribes, however, were under five leaders, by whom Ireland was divided into five provinces. With Slainge, the first Firbolg king, who began to reign 1934 B.C., and reigned only one year, the Irish historians begin their account of the Irish monarchy and list of kings. The F. were driven out, after they had been thirty-six years in Ireland, by their kinsmen, the Tuatha de Danann, from Scotland, they having previously passed over to that country from Lochlan; and these, in their turn, were expelled or conquered by the Milesians. The most recent investigators of the early history of Ireland regard the story of the F. as having some basis of truth, but no chronological accuracy; the different tribes having long subsisted in the country together, and with varying fortunes as to temporary superiority. See IRELAND.

FIRDUSI, FIRDOWSI (TUSI), ABU'L-KASIM MANSUR, the greatest epic poet of Persia, was b. between 304–328 H., or 916–940 A.D., at Shadab or Rizvan, near Tus in Khorassan. Whether the name F. (from *firdus*, garden, paradise) was given to him because his father (Fachreddin Ahmad) was a gardener, or on account of the "paradise of poetry" which he had created, is matter of controversy. All that is known of his early life is, that when a boy he was very industrious, and also that "he loved to sit for days alone on the bank of a river." At the age of between thirty and forty, he went to Gazneh, where Mahmud de Gaznewide, a great admirer and patron of poetry and the arts generally, then resided. Erelong, F. had an opportunity of displaying both his talent and his extraordinary knowledge of ancient Persian history and legendary lore before the sultan himself, who was so pleased with an episode (the story of Sijavush) written by him at his majesty's order, that he at once paid him a gold dirhem for each couplet, and shortly afterwards sent him a great number of fragmentary ancient chronicles and histories of Persia, that he might versify them, and thus carry out the task once attempted by Dakiki—viz., to write a poetical history of the Persian kings from the creation of the world to the end of the Sassanide dynasty (636 A.D.)—the reward to be a dirhem a line. F. spent thirty years over the work, and produced the famous *Book of Kings* (*Shah Nameh*), consisting of 60,000 double lines. Without going so far as many critics have gone, we may fairly rank it among the greatest epics of all nations: the *Iliad*, the *Mahábhárata*, the *Nibelungen*. Truth and fiction, history and fairy lore, all the most gorgeous imagery of the east and its quaintest conceits, together with the homeliest and most touching descriptions of human joy and human sorrow, of valor and of love, the poet has formed into one glowing song. Though abounding—in strict adherence to its sources—in impossibilities and anachronisms (such as Alexander the great being a Christian, Ki-Khosroo holding the Zend Avesta in his hands—some hundred and twenty years before it was brought to light—Abraham being Zerdusht, etc.), it yet contains not a little that is of real historical value, quite apart from its being the most faithful mirror of its own times. See SHAH NAMEH. But while F. was "weaving his poetical carpet," his enemies had not been idle. Unable to attack his genius and his honesty, they attacked his religious opinions; and the sultan, influenced by bigotry and avarice, sent the poet, instead of 60,000 dirhems of gold, so many dirhems of silver. F. was at a public bath when the messenger arrived with the money, and on discovering that it was silver, and not gold, Mahmud had sent him, he divided the amount into three portions, and gave one to the attendant at the bath, another to the messenger, and the third to a man who brought him a glass of sherbet. He then burned several thousand verses which he had written in praise of the sultan, as sequel to the *Shah Nameh*, and composed one of the bitterest satires against him, which he handed over, well sealed, to the king's favorite slave, to give it to him when he might be seized with one of his fits of despondency, as it contained a beautiful panegyric on him. Dreading the sultan's rage, he fled precipitately, first to Tus; persecuted here, he next went to Bagdad, where Kadir Billah, the caliph, received him with all honor. But the unrelenting anger of Mahmud followed him thither, and he removed to Tabaristan, which again he had to leave, to seek another place of refuge. After eleven years of restless wanderings, he was at last allowed to return to his native place, a broken, wretched old man. Mahmud is said to have repented his cruelty at last, and to have sent a caravan loaded with the costliest goods to F., to entreat his forgiveness, and induce him to become once more the star of his court. But while the king's messengers entered one gate of the city, F.'s bier was carried out to his last abode by the other, 1020 A.D. (411 H.). His only daughter—an only son of his had died long before him at the age of 37 years—

refused the sultan's present, and certain buildings were erected instead, in honor of the dead poet.

The great popularity which the *Shah Nameh* has always enjoyed in the east, is to a certain amount also the cause of the uncritical state of the texts. Every transcriber shaped and molded certain passages, or even episodes, according to his own fancy, so that not two out of the innumerable copies are quite alike. Nor are the 60,000 couplets extant in any one instance, the utmost number, including all the most palpable interpolations, never exceeding 56,600. The first complete edition of the text, with a glossary and introduction, was published by Turner Macan (Calcutta, 1829, 4 vols.). Another edition, with a French translation, was published by Mohl (Paris, 1840, etc.). Champion published some English extracts in 1788. F. also wrote another poem, *Yusuf and Zuleikha*, which has been edited by Morley, and a *Divan*, or collection of poems. Many European orientalists have written on F.; among others, Hammer, Wahl, Görres, Schack, Rückert, Morley, Ouseley, Atkinson, Nasarianz, etc.

FIRE. For the superstitions connected with fire. See BELTEIN, NEED-FIRE, and SUN AND FIRE WORSHIP.

FIRE. Whether a tribe of men ignorant of fire and its uses has ever existed, is a question in dispute among historians and travelers. It will be enough to say that absolute proof of the existence of such a tribe has not been presented, though there are many well authenticated facts and circumstances that suggest its possibility. The uses and dangers of fire, and to a certain extent the means of controlling it, must have been generally understood at a very early age. At first it may have been simply an object of terror, but probably men soon discovered that it was a friend no less than an enemy. Concussion or friction was undoubtedly the earliest method employed for producing fire. In the process of chipping stone, sparks were elicited, which, falling upon combustible substances, may have taught men how to produce a blaze at pleasure. The concussion of flint and steel was for ages doubtless the common method of kindling a fire, and it has not yet been entirely superseded. The Alaskans strike together two pieces of quartz, rubbed with sulphur, thereby setting the sulphur on fire, and then transfer the flame to a heap of dry grass. The Esquimaux use quartz and iron pyrites. In some countries sparks are produced by striking a piece of broken china upon bamboo; in Cochin China two pieces of bamboo are used, the silicious character of the outside layer of this wood rendering it as good as native flint. Numerous mechanical devices, for increasing by rapidity of motion the friction of different woods, were resorted to. In some cases a stick was rubbed backwards and forwards; in others it was made to rotate rapidly in a round hole in a stationary piece of wood. This method was used by the North American Indians, who improved it by applying the principle of the bow-drill. The Iroquois used the still more ingenious pump-drill. The production of fire by concentrating the rays of the sun by means of a burning-glass was well known to the ancients. North American legends narrate how the great buffalo, careering through the plains, makes sparks flit in the night, and sets the prairie ablaze by his hoofs hitting the rocks. The same idea appears in the Hindu mythology. To save the labor required in these initial processes of procuring light, and to avoid the inconvenience of carrying it about continually, primitive men hit on the expedient of a fire which should burn night and day in a public building. The Egyptians had one in every temple, the Greeks, Latins, and Persians in all towns and villages. Of these the "eternal lamps" in the Byzantine and Catholic churches may be the survival. Even the functions of the state itself, according to some eminent writers, appear to have grown out of the care bestowed on the tribal fire. The first guardians of this fire, it is said, were the earliest public servants, who by degrees appropriated all important offices, as the state itself developed into a vast aggregation of interests. The men who in the Roman empire took charge of the tribal fire were called the prytanes. They were fed at the public expense, and they became magistrates, in whom were combined the powers of captain, priest, and king. When Augustus usurped the authority of imperator, he assumed the powers which belonged to a board of flamens, or of prytanes. He made himself pontifex maximus and assumed the charge of the public fire. The Hellenic nations, as well as the Aztecs, received their ambassadors in their temples of fire, where, as at the national hearth, they feasted the foreign guests. The prytaneion and the state were convertible terms. If by chance the fire in the Roman temple of Vesta was extinguished, all tribunals, all public or private business had to stop immediately. No Greek or Roman army crossed the frontier without carrying an altar where the fire taken from the prytaneion burned night and day. Greek colonies went not forth without living coals from the altar of Hestia, to light in their new country a fire like that burning at the old home. Architecture, it is supposed, began with the creation of sacred sheds to protect the sacred fire, which was looked upon as a divinity. The fire that burned in the temple of Vesta was regarded as the very goddess herself. The hearth fire was kept holy, its flame was to remain bright and pure. According to the Zend Avesta nothing unclean was to be thrown into the fire, and no indecent actions are to be committed before it. To spit in one's fire would be considered in some places an unpardonable offense. Some people were so reverent that they would not blow out a light lest they should render the flame impure with their breath. In the course of time, the same

reasons which led to the provision for a tribal fire induced every family to have its hearth. The family developed itself only after the married pair and their offspring had their own fire-place. This family fire was at first the privilege of only the aristocracy. The hearth was the very center of the house, as the regia was the sacred center of Rome and the Roman commonwealth; around the regia the civic and politic institutions developed themselves; and around the hearth the family grew slowly into shape and power. Let us hope it may not decline under the influence of those "modern improvements" which have superseded the hearth-stone and banished from sight the household fire. The Gentile hearth gave a recognized asylum—a right still in full vigor in some countries. The proud saying of the Englishman that his home is his castle is a remnant of this old feeling. According to the ancient belief the soul and the fire were identical. As the sun gave life to the earth, so the fire on the hearth radiated life within the house. It was the seat of the Lares and Penates, of the ancestors; a dwelling-place for the deceased; there also a stock of souls ready to enter into existence by new births was maintained. The Vedas taught that the hearth-fire was co-substantial with the cause of generation. Hence care was taken to preserve the purity of descent in the kin by preserving the flame of the hearth pure and unmingled with the fire taken from another house. The ancient Persians fed their fires, and especially their sacred fires, with only certain kinds of wood reputed to be cleaner than others, well dried and stripped of the bark. In all countries it was considered a fatal omen if the fire died out on the hearth. A new fire was to be lighted by the friction of two twigs, as to fetch some from a neighbor's would have been considered an adulterous union of hearths, an undue mingling of the blood of two families. The ancient naturalists supposed that the generation of fire by the friction of two woods, one of harder, the other of softer substance, was the exact counterpart of human generation. Life was compared to a flame, to a torch, and no comparison can be more true. A torch that was put out by throwing it violently on the ground symbolized in ecclesiastical rites excommunication, or the condemnation of a soul to eternal death. Sickness being identified with sin, fire became the first and most esteemed of curative agents. The mother, after delivery, walked through fires lighted on her right hand and on her left; the infants, especially the males, were fumigated with great care. Among some populations none could approach mother and child without stepping over a brazier. Fiery ordeals heralded the attainment of the age of puberty by both sexes. Purification by fire led to the institution of baptism by fire, which in many places was thought vastly superior to baptism by water; and the idea obtained its furthest development in the notion of purgatorial fires.

Not to dwell longer on the symbolic and superstitious uses of fire, we pass to a consideration of it in its relations to the destruction by it of life and property. History is full of accounts of its ravages in all parts of the civilized world. The following list embraces the more memorable of the great fires of which records have been preserved:

Great Britain and Ireland.

798. London; nearly destroyed.
982. " greater part of the city burned.
1086. " all houses and churches from the east to the west gate burned.
1212. " greater part of the city burned.
1666. " "The great fire," Sept. 2 to 6. It began in a wooden house in Pudding lane, and burned for three days, consuming the buildings on 436 acres, 400 streets, lanes, etc., 13,200 houses, with St. Paul's church, 86 parish churches, 6 chapels, the guildhall, the royal exchange, the custom-house, many hospitals and libraries, 52 companies' halls, and a vast number of other stately edifices, together with 3 of the city gates, 4 stone bridges, and the prisons of Newgate, the Fleet, and the Poultry and Wood street compters. The fire swept from the Tower to the Temple church, and from the n.e. gate to Holborn bridge. Six persons were killed. The total loss of property was estimated at the time to be $53,652,500.
1794. " 630 houses destroyed at Wapping. Loss above $5,000,000.
1834. " houses of parliament burned.
1861. " Tooley street wharves, etc., burned. Loss estimated at $10,000,000.
1873. " Alexandra palace destroyed.
1137. York; totally destroyed.
1184. Glastonbury; town and abbey burned.
1507. Norwich; nearly destroyed; 718 houses burned.
1612. Tiverton; 600 houses burned. Loss, $1,000,000.
1700. Edinburgh; "the great fire."
1612. Cork; greater part burned, and again in 1622.
1613. Dorchester; nearly destroyed. Loss, $1,000,000.
1614. Stratford-on-Avon; burned.
1760. Portsmouth; dock-yard burned. Loss, $2,000,000.
1802. Liverpool; loss, $5,000,000.
1875. Glasgow; loss, $1,500,000.

France.

1118. Nantes; greater part of the city destroyed.
1137. Dijon; burned.
1524. Troyes; nearly destroyed.
1720. Rennes; on fire from Dec. 22 to 29; 850 houses burned.
1784. Brest; fire and explosion in dock-yard. Loss, $5,000,000.
1871. Paris; communist devastations. Property destroyed, $160,000,000.

Central and Southern Europe.

64. Rome; burned during 8 days; 10 of the 14 wards of the city were destroyed.
1106. Venice; greater part of the city was burned.
1577. " fire at the arsenal; greater part of the city ruined by an explosion.
1405. Bern was destroyed.
1457. Dort; cathedral and large part of the town burned.
1491. Dresden was destroyed.
1764. Königsberg; public buildings, etc., burned. Loss, $3,000,000.
1769. " almost destroyed.
1784. Rokitzan (Bohemia) was totally destroyed. Loss, $1,500,000.
1801. Brody; 1500 houses destroyed.
1859. " 1000 houses destroyed.
1803. Posen; large part of older portion of city burned.
1818. Salzburg was partly destroyed.
1842. Hamburg; a fire raged for 100 hours, May 5 to 7. During the fire the city was in a state of anarchy. 4,219 buildings, including 2,000 dwellings, were destroyed. One fifth of the population was made homeless, and 100 persons lost their lives. The total loss amounted to $35,000,000. After the fire, contributions from all Germany came in to help rebuild the city.
1861. Glarus (Switzerland); 500 houses burned.

Northern Europe.

1702. Bergen; greater part of the town destroyed.
1728. Copenhagen; nearly destroyed; 1650 houses burned, 77 streets.
1794. " royal palace with contents burned.
1795. " 50 streets, 1563 houses.
1751. Stockholm; 1000 houses destroyed.
1759. " 250 houses burned. Loss, $2,420,000.
1775. Abo; 200 houses and 15 mills burned.
1827. " 780 houses burned, with the university.
1790. Carlscrona; 1087 houses, churches, warehouses, etc., destroyed.
1858. Christiania; loss estimated at $1,250,000.
1865. Carlstadt (Sweden); everything burned except the bishop's residence, hospital, and jail. Ten lives lost.

Russia.

1736. St. Petersburg; 2,000 houses burned.
1862. " great fire. Loss, $5,000,000.
1752. Moscow; 18,000 houses burned.
1812. " the Russians fired the city on Sept. 14, to drive out the army of Napoleon. The fire continued five days. Nine tenths of the city was destroyed. Number of houses burned, 30,800. Loss, $150,000,000.
1753. Archangel; 900 houses burned.
1793. " 3,000 buildings and the cathedral burned.
1786. Tobolsk; nearly destroyed.
1848. Orel; large part of the town destroyed.
1850. Cracow; large part of the town burned.
1864. Novgorod; large amount of property destroyed.

Turkey.

The following fires have occurred at Constantinople:

1729. A great fire destroyed 12,000 houses and 7,000 people.
1745. A fire lasted five days.
1750. In Jan., 10,000 houses burned; in April, property was destroyed estimated from $5,000,000 to $15,000,000. Later in the year, 10,000 houses were destroyed.
1751. 4,000 houses were burned.
1756. 15,000 houses and 100 people destroyed. During the years 1761, 1765, and 1767, great havoc was made by fire.
1769. July 17. A fire raged for twelve hours, extending nearly 1 m. in length. Many of the palaces, some small mosques, and nearly 650 houses were destroy ed.
1771. A fire lasting 15 hours consumed 2,500 houses and shops.
1778. 2,000 houses were burned.

1782. Aug. 12. A fire burned three days: 10,000 houses, 50 mosques, and 100 corn-mills destroyed; 100 lives lost. In Feb., 600 houses burned; in June, 7,000 more.
1784. Aug. 5. A fire burned for 26 hours, and destroyed 10,000 houses, most of which had been rebuilt since 1782. In the same year, Mar. 13, a fire in the suburb of Pera destroyed two thirds of that quarter. Loss estimated at 2,000,000 florins.
1791. Between March and July, 32,000 houses are said to have been burned, and as many in 1795.
1799. In the suburb of Pera 13,000 houses were burned, and many magnificent buildings.
1816. Aug. 16. 12,000 houses and 3,000 shops in the finest quarter were destroyed.
1818. Aug. 13. A fire destroyed several thousand houses.
1826. A fire destroyed 6,000 houses.
1848. 500 houses and 2,000 shops destroyed. Loss estimated at $15,000,000.
1865. A great fire destroyed 2,800 houses, public buildings, etc. Over 22,000 persons were left homeless.
1870. June 5. The suburb of Pera, occupied by the foreign population and native Christians, was swept by a fire which destroyed over 7,000 buildings, many of them among the best in the city, including the residences of the foreign legations. Loss estimated at nearly $25,000,000.

1797. Scutari; the town of 3,000 houses totally destroyed.
1763. Smyrna; 2,600 houses consumed. Loss, $1,000,000.
1772. " 3,000 dwellings burned; 3,000 to 4,000 shops, etc., consumed. Loss, $20,000,000.
1796. " 4,000 shops, mosques, magazines, etc., burned.
1841. " 12,000 houses were burned.

India.

1631. Rajmahal; palace and great part of the town burned.
1799. Manilla; vast store-houses were burned.
1833. " 10,000 huts were burned, Mar. 26; 30,000 people rendered homeless and 50 lives lost.
1803. Madras; more than 1000 houses burned.
1803. Bombay; loss by fire of $3,000,000.

China and Japan.

1822. Canton was nearly destroyed by fire.
1866. Yokohama; two thirds of the native town and one sixth of the foreign settlement destroyed.
1872. Yeddo; a fire occurred in April during a gale of wind, destroying buildings covering a space of 6 sq. m.; 20,000 persons were made homeless.
1873. Yeddo; a fire destroyed 10,000 houses.

United States.

1679. Boston; all the warehouses, 80 dwellings, and the vessels in the dock-yards were consumed. Loss, $1,000,000.
1760. " a fire caused a loss estimated at $500,000.
1872. " great fire, Nov. 9 and 10. By this fire the richest quarter of Boston was destroyed. The fire commenced at the corner of Summer and Kingston streets. The area burned over was 65 acres; 776 buildings, comprising the largest granite and brick warehouses of the city, filled with merchandise, were burned. The loss was about $75,000,000. Before the end of the year 1876, the burned district had been rebuilt more substantially than before.
1778. Charleston; a fire caused the loss of $500,000.
1838. " one half of the city was burned, April 27; 1158 buildings destroyed. Loss, $3,000,000.
1820. Savannah; 463 buildings were burned. Loss, $4,000,000.
1776. New York; Sept. 21 (six days after the British took possession of the city), all the w. side, from Broadway to the North river, was burned.
1811. " about 100 houses burned on Chatham street.
1835. " the great fire of New York began in Merchant street, Dec. 16, and burned 530 buildings in the business part of the city; 1000 mercantile firms lost their places of business. The area burned over was 52 acres. The loss was $15,000,000.
1845. " a fire in the business part of the city, July 20, destroyed 300 buildings. The loss was $7,500,000. 35 persons were killed.
18[illegible] Pittsburg; a large part of the city burned, April 11; 20 squares, 1100 buildings destroyed. Loss, $10,000,000.

1877. Pittsburg; riot of railway workmen. Loss over $3,260,000. These claims were compromised at $1,600,000. Of railroad rolling stock there were wholly destroyed and partially damaged 107 locomotives. There were wholly destroyed 33 passenger coaches, 5 Pullman palace coaches, 3 officers' coaches, 7 emigrant coaches, 3 combined baggage and passenger coaches, 1 paymaster's car, 8 baggage cars, 10 express cars, 2 postal cars, 951 box or house cars, 92 refrigerator cars, 34 stock cars, 856 gondola or flat cars, 48 cabin or freight conductors' cars, 1 tool car, 98 coal and coke cars.
1846. Nantucket was almost destroyed.
1848. Albany; 600 houses burned, Aug. 17. Area burned over, 37 acres, one third of the city. Loss, $3,000,000.
1849. St. Louis; 23 steamboats at the wharves, and the whole or part of 15 blocks of the city burned, May 17. Loss, $3,000,000.
1851. " more than three quarters of the city was burned, May 4; 2,500 buildings. Loss, $11,000,000.
1851. " 500 buildings burned. Loss, $3,000,000.
1850. Philadelphia; 400 buildings burned, July 9; 30 lives lost. Loss, $1,000,000.
1851. San Francisco; on May 4 and 5, a fire destroyed 2,500 buildings. A number of lives lost. More than three fourths of the city destroyed. Loss upwards of $10,000,000. In June another fire burned 500 buildings. Loss estimated at $3,000,000.
1866. Chicago; two fires, on Aug. 10 and Nov. 18. Loss, $500,000 each.
1871. " the greatest fire of modern times. It began on the night of the 8th of Oct., and raged until the 10th. The area burned over was 2,124 acres, or 3¼ sq. m., of the heart of the city; 250 lives were lost, 98,500 persons were made homeless, and 17,430 buildings were consumed. The buildings were one third in number and one half in value of the buildings of the city. Before the end of 1875, the whole burned district had been rebuilt. The loss was estimated at $195,000,000.
1862. Troy (N. Y.) was nearly destroyed by fire.
1866. Portland; great fire on July 4. One half of the city was burned; 200 acres were ravaged; 50 buildings were blown up to stop the progress of the fire. Loss, $10,000,000 to $11,250,000.
1871. October; large forest fires in Wisconsin and Michigan; 15,000 persons were made homeless; 1000 lives lost. Loss estimated at $3,000,000.

British North America.

1815. Quebec was injured to the extent of $1,300,000.
1845. " 1650 houses were burned, May 28. One third of the population made homeless. Loss from $2,000,000 to $3,750,000. Another fire, on June 28, consumed 1300 dwellings; 6,000 persons were made homeless; 30 streets destroyed. Insurance losses, $303,850.
1866. " 2,500 houses and 17 churches in French quarter burned.
1825. New Brunswick; a tract of 4,000,000 acres, more than 100 m. in length, was burned over; it included many towns; 160 persons killed, and 875 head of cattle; 590 buildings burned. Loss about $300,000. Towns of Newcastle, Chatham, and Douglastown destroyed.
1837. St. John (New Brunswick); 115 houses burned, Jan. 13, and nearly all the business part of the city. Loss, $5,000,000.
1877. " great fire on June 21. The area burned over was 200 acres; 37 streets and squares totally or in part destroyed; 10 m. of streets; 1650 dwellings; 18 lives lost. Total loss, $12,500,000. Two fifths of the city destroyed.
1846. St. John's (Newfoundland); nearly destroyed, June 9. Two whole streets burned, upwards of 1 m. long. Loss estimated at $5,000,000.
1850. Montreal; a fire destroyed the finest part of the city on June 7; 200 houses were burned.
1852. " a fire, July 9, rendered 10,000 people destitute. The space burned was one mile in length by half a mile in width, including 1200 houses. Loss, $5,000,000.

South America.

1536. Cuzco was nearly consumed.
1861. Mendoza; a great fire followed an earthquake which had destroyed 10,000 people.
1862. Valparaiso was devastated by fire.
1863. Santiago; fire in the Jesuit church; 2,000 persons, mostly women and children, perished.

West Indies.

1752. Pierre (Martinique) had 700 houses burned.
1782. Kingston (Jamaica) had 80 houses burned. Loss, $2,500,000.

1795. Montego Bay (Jamaica); loss, $2,000,000.
1805. St. Thomas; 900 warehouses consumed. Loss, $30,000,000.
1808. Spanish Town (Trinidad) was totally destroyed. Loss estimated at $7,500,000.
1828. Havana lost 350 houses; 2,000 persons reduced to poverty.
1843. Port Republican (Hayti); nearly one third of the town was burned.

The causes of the conflagrations above recorded, and the reasons why many of them were so extensive, are not far to seek. Wooden buildings crowded together upon narrow streets and filled with combustible materials, radical faults of construction, an insufficient supply of water, the lack of proper engines and other appliances, and the want of organization, are sufficient to account for such calamities. When, however, a conflagration has passed certain limits, there appear to be no agencies of human forethought or application which can control it. The Chicago fire, driven by a gale which was almost a hurricane, raged for a day through wide streets, consuming buildings of the best material, erected with the greatest care, in the most substantial manner. The wind carried great masses of burning brands skirmishing far in advance of the grand army of destruction, and constantly starting new fires, which the combined fire-brigades of the chief cities of the land could not have prevented or extinguished. It should be remembered, moreover, that these and other similar tables record only a small proportion of the losses by fire. The great conflagrations make a strong impression upon the public, while no record whatever is made of the vast number of smaller fires which in the aggregate are still more destructive. The value of the insured property destroyed annually by fire in the whole world has been estimated at from one hundred and twenty to two hundred millions of dollars. If we add to this the losses from the destruction of property uninsured, the figures will be startling indeed. The property slowly accumulated by the labor of thousands and tens of thousands of men may, for want of care, perish in a night, and the loss to the community would in no way be alleviated if the whole were insured. The question how fires may be most effectually prevented, and, when they occur, how they may be most surely and rapidly extinguished, is of the highest importance to mankind; and some light may be thrown upon the subject by considering the actual causes or occasions of fires, so far as they are known. The following abstract of the results deduced from about 30,000 fires occurring in London within a period of 33 years (1833–65), is of general interest. The percentages of causes were: candles, 11.07; children playing, 1.59; defective flues, 7.80; friction matches, 1.41; smoking tobacco, 1.40; sparks of fire, 4.47; spontaneous ignition, 0.95; stoves, 1.67; other known causes, 19.40; unknown causes, 32.88. Incendiarism would doubtless be found upon inquiry to account for a large proportion of the fires whose causes are here marked "unknown."

The following statistics of fires occurring in the city of New York in 1876–79 are taken from the reports of the fire department:

FIRES IN THE CITY OF NEW YORK.

Years.	No.	Loss.	Insurance.	Uninsured loss.	Expenditure for Fire Department.
1876	1,382	$3,851,213	$12,667,009	$82,138	$1,243,386 89
1877	1,450	3,210,695	12,508,627	122,685	1,223,391 95
1878	1,655	1,883,052	14,341,072	142,702	1,240,920 26
1879	1,551	5,671,580	21,801,710	180,060	1,219,021 34
Total	6,038	$14,616,540	$61,318,418	$527,585	$4,926,720 44

CAUSES OF FIRES IN THE CITY OF NEW YORK.

Years.	Carelessness.	Children playing with matches and fire.	Defective flues, etc.	Escaped gas.	Fat, oil, taking fire.	Foul chimneys.	Heat from grates, etc.	Incendiary.	Kerosene lamps.	Not ascertained.	Overheated stoves, etc.	Sparks from chimneys, etc.	Spontaneous combustion.	Window curtains, etc., from gas-lights.	Other causes.	Total.
1876	371	77	44	26	20	144	24	19	94	94	45	79	25	60	260	1,382

Per cent.	26.1	6.1	3.0	1.9	1.9	11.4	2.8	1.2	7.9	6.4	3.5	6.7	2.2	5.3	13.3	

The study of this table will show in what a vast proportion of cases fires are the result of preventable causes—in other words, of carelessness that ought to be avoided. The general diffusion of information such as this would no doubt diminish in some degree the number of fires, while the use of incombustible building materials would have a still more powerful effect. But so long as the present modes of building prevail, the main dependence for preventing or diminishing losses by fire must be upon efficient organization and the use of the best means and appliances for the sure and quick extinguishment of fires when once they have been kindled. In this respect there have been great improvements in the last few years, and doubtless others will be made in the future. By means of the electric fire-alarm the knowledge of the existence of a fire and of its precise location is diffused with a rapidity formerly unknown. The fire departments in our large cities and towns are so organized as to respond instantly to an alarm. Engines worked by steam-power are ready to move at once, and they are conveyed to the desired spot by horses trained to move swiftly and with almost human intelligence. The firemen are systematically and thoroughly trained, and led by men selected for their experience, energy, and courage. The best appliances that science can suggest are ever at command; above all, the supply of water is abundant. The firemen seek first to extinguish the fire and save the building in which it broke out; if that be found impossible, they direct their efforts towards its circumscription or limitation. When a building is filled with flame there is no use in trying to save it; the thing to be done is to prevent the fire from spreading to other buildings. The use of gunpowder and other means of breaking connection with neighboring buildings is sometimes necessary.

The New York fire department is thoroughly organized. A military spirit pervades all its regulations and movements. It is under the direction of a board of three commissioners, appointed by the mayor. The active force, divided into battalions and subdivided into companies—in all about 800 men—is under the command of a chief of department, supported by an assistant and chiefs of battalion. Each engine and ladder company is provided with a house of its own where the men live and their horses and apparatus are kept. The whole force is required to be constantly on duty and in the houses, except such of the number as are on street parole or at their meals. The horses are kept in stalls facing the engine, and are loosened by an automatic electric arrangement upon the instant that an alarm is struck. The moment they hear the sound of the gong they advance without further order to their places at the pole of the engine, the harness drops at a touch from its place of suspension and is fastened upon them in a second, the men leap to their places, and the carriage is driven at high speed to its destination. The engine is at all times kept supplied with water at a boiling point from stationary engines, and a fire is lighted under the boiler the instant it leaves the house, so that when it reaches the scene of danger a full pressure of steam is provided. So quickly is all this done, that in from three to five minutes after an alarm, streams of water are usually in full play upon the fire. The city is divided into battalion districts of small area, and the signal boxes of the fire-alarm telegraph are so placed as to afford the means of giving an alarm the moment a fire is discovered. The first alarm, calls out only a small force in the neighborhood where it is needed, if additional force is required, other alarms are given. The firemen are carefully trained, and acquire a high degree of skill in the performance of their duties. In ordinary circumstances they are able to extinguish a fire before it can do much damage; it is only when it has gained great headway before discovery, or when there are obstructions preventing ready access thereto, or when the supply of water fails, that they are unable to get it under quick control. See FIRE-ENGINE. [From *Ency. Brit.*, 9th ed.]

FIRE, in armorial bearings, is used to denote those who, being ambitious of honor, perform brave actions with an ardent courage, their thoughts always aspiring as the fire tends upwards. A flame of fire is more frequently used as a charge in France and Germany than in this country; but we have fire-balls or bombs, fire-beacons, firebrands, fire-buckets, etc., in abundance.

FIRE, ORDEAL BY. See ORDEAL.

FIRE, ST. ANTEONY'S. See ERYSIPELAS.

FIRE-ALARM, apparatus, mechanical, electric, and telegraphic, used for detecting fires, or for warning the fire department that fires exist. A series of signal-boxes is distributed over a given area, each box having a distinctive number, and being connected with the central station and with alarm-bells in the several engine-houses. A signal-box contains a transmitter, consisting of a metallic wheel, provided with suitably arranged teeth; the spaces between the teeth are filled with some non-conducting substance, as ivory; a contact spring rests against the wheel, and, as the wheel is turned, touches in succession the projecting teeth, at each tooth making the circuit, and causing a signal at all receiving stations. If the arrangement should be, two teeth, a space, three teeth, a space, and two teeth, followed by a long space, one rotation of the wheel would give two signals, then three, then two, or the number 232, and this number will be repeated as often as the wheel is rotated. The wheel may be turned by a crank, or by a spring, acting so long as a detent is held away. The signal is received upon the common Morse instrument, and recorded on a strip of paper.

The automatic fire-detecter is a thermometer which has a platinum wire sealed into its bulb, and a second wire inserted at the mark of a certain temperature on the scale. The wires are in a telegraphic circuit, which remains broken until the increasing temperature causes the mercury to rise in its tube, and complete the connection by contact with the second wire. A signal is instantly communicated to the central station, showing the danger and the precise building at which it exists; an indicator, usually placed near the door, further shows from which apartment the signal was made, directing the fireman to the precise place where his services are in demand. The thermometer is usually placed in the ceiling. Insurance companies make reduced rates upon buildings provided with this instrument. Other devices have employed the ignition of powder, the expansion of metallic rods, or the breaking of wires, but none are so delicate or so worthy of reliance as that described.

FIRE ANNIHILATOR. An apparatus bearing this name was patented by Mr. Phillips in 1849, and attracted a good deal of public attention, as it was expected at the time that it would supersede the ordinary fire-engine (q.v.). The object of this invention was to extinguish fires by pouring into the midst of the conflagration streams of carbonic acid, sulphurous acid, and other gases which do not support combustion. A bottle containing sulphuric acid was placed immediately over a mixture of chlorate of potash and sugar, which, again, was surrounded by a mixture of charcoal, niter, and gypsum. On breaking the bottle, the sulphuric acid drops upon the chlorate of potash and sugar, which, as is well known to chemists, produces immediately an intense combustion of the sugar; the heat from this fires the surrounding mixture, and dense volumes of the above-mentioned gases are evolved. It is found, however, to be practically of little value in ordinary fires, where the air has free access.

FIRE ARMOR, an appliance intended to facilitate escape from a burning building, or to enable a person to remain in it with safety while engaged in extinguishing a fire. It is in principle much the same as the submarine armor now in common use. Fire armors began to be used about half a century ago, but only within a few years have they been so constructed as to be practically effective. The latest invention is that of George A. Crofutt, of New York, called by him an "eye and lung protector." It is a mask for the face, which removes the noxious qualities of the air before it enters the lungs, and protects the eyes of the wearer from dust, smoke, etc., enabling him to "see as through a glass darkly" while laboring to extinguish a fire or to save life. A double shell of thin steel covered with India-rubber is held in place by an elastic band about the head. This shell is provided with eye-holes, in which are set plates of transparent mica. The India-rubber covering of the shell, falling a little below its edge, tightens itself so closely as to prevent the intrusion of smoke and dust. For the protection of the lungs, a porous curtain, suspended from the covering of the shell, falls below the chin and is drawn by a string closely around the neck of the wearer. Within the curtain and over the mouth and nostrils is placed a moist and carefully filtered sponge, through which the wearer breathes, and which, while cooling the air, divests it of its noxious qualities. This ingenious appliance is very light, and may be fitted to its place almost as quickly as a man puts on his hat. Many experiments have proved its efficacy. The wearer is able to remain from 20 minutes to half an hour in a room filled with smoke and foul gases.

FIRE-ARMS may be defined as vessels—of whatever form—used in the propulsion of shot, shell, or bullets, to a greater or less distance, by the action of gunpowder exploded within them. They have played so great a part in the world's story, that their invention, development, and science deserve careful analysis. At a more advanced period, an obvious division of the subject into cannon, mortars, and small-arms presents itself; but in the infancy of the invention, and amid the obscurity enshrouding it, we can only seek to inquire into the origin of fire-arms generally.

The invention of gunpowder bears so directly upon the gradual introduction of fire-arms, that it will be well to consider the two discoveries concurrently. The widely prevalent notion that gunpowder was the *invention* of friar Bacon, and that cannon were first used by Edward III. of England, must be at once discarded. It is certain that gunpowder differed in no conspicuous degree from the *Greek fire* of the Byzantine emperors, nor from the *terrestrial thunder* of China and India, where it had been known for many centuries before the chivalry of Europe began to fall beneath its leveling power.

"Niter," says sir George Staunton, "is the natural and daily produce of China and India; and there, accordingly, the knowledge of gunpowder seems to be coeval with that of the most distant historic events." The earlier Arab historians call saltpeter "Chinese snow" and "Chinese salt;" and the most ancient records of China itself show that, when they were written, fire-works were well known several hundred years before the Christian era. From these and other circumstances, it is indubitable that gunpowder was used by the Chinese as an explosive compound in prehistoric times; when they first discovered or applied its power as a propellant, is less easily determined. There is an account of a bamboo tube being used, from which the "impetuous dart" was hurled a distance of 100 ft.; this was at a very early period, but it is difficult to say precisely when. It is recorded, however, that in 618 B.C., during the Taing-off dynasty, a cannon was employed, bearing the inscription: "I hurl death to the traitor, and extermination

to the rebel." This must almost necessarily have been of metal. We have also curious evidence in regard to the armament of the great wall; for capt. Parish, who accompanied lord Macartney's mission, reported that "the soles of the embrasures were pierced with small holes, similar to those used in Europe for the reception of the swivels of wall-pieces. The holes appear to be part of the original construction of the wall, and it seems difficult to assign to them any other purpose than that of resistance to the recoil of fire-arms." If this surmise be correct, the use of jingalls would be carried back to three centuries at least before the Christian era. Stone mortars, throwing missiles of 12 lbs. to a distance of 300 paces, are particularly mentioned as having been employed in 757 A.D. by Thang's army; and in 1232 A.D., it is incontestable that the Chinese besieged in Caifong-fou used cannon against their Mongol enemies. Thus, the Chinese must be allowed to have established their claim to an early practical knowledge of gunpowder and its effects.

It seems likely, however, that the principles of fire-arms reached Europe from India rather than China, and that country has equal, if not superior, claims to the first acquaintance with the art. The ancient Sanscrit writings appear to point very plainly to the operation of some primitive sort of cannon, when, in recording the wars of the Egyptian Hercules in India, it is stated that the sages remained unconcerned spectators of the attack on their stronghold, till an assault was attempted, when they repulsed it with whirlwinds and thunders, hurling destruction on the invaders; and a Greek historian of Alexander's campaign testifies that the Hindus had the means of discharging flames and missiles on their enemies from a distance.

These Indian philosophers seem, from the writings of Ctesias and Ælian, to have also possessed an unquenchable fire similar to that employed later by the Greeks. Passing from these very early times, in which there is reason to believe that some sort of great gun was employed, we come to the comparatively recent date, 1200 A.D., when their use is established beyond a doubt, for Chaséd, the Hindu bard, writes (in stanza 257) that the culivers and cannons made a loud report when they were fired off, and that the noise of the ball was heard at the distance of about ten coss, which is more than three quarters of a mile. In 1258, the vizir of the king of Delhi went forth to meet the ambassador of Hulaku, the grandson of Genghis Khan, with 3,000 carriages of fire-works (in the sense of weapons, probably a sort of rude muskets). In 1368, 300 gun-carriages were captured by Muhammed Shah Bahmiani. The use of cannon had so far advanced in India by 1482, that they were even used for naval purposes; shells having been employed two years earlier by the sovereign of Guzerat. In 1500, the Portuguese had matchlockmen to contend with, as well as heavy ordnance. Pigafetta, in 1511, found the town of Borneo defended by 62 pieces of cannon mounted on the walls. So much for the antiquity and apparently common use of fire-arms in China and India, at times long antecedent to any knowledge of them in Europe, and during the period at which they were scarcely developed in an effectual degree. Most of the pieces discovered in India, and supposed to be of early manufacture, are composed of parallel iron bars welded together, and very often they had a movable breech-piece.

The knowledge of gunpowder and fire-arms may be presumed to have extended in a westerly direction through the Arabs, whom we find using them possibly in 711 A.D., under the name of *manjaniks*, and certainly very early in the 14th century. The Byzantine emperor, Leo, introduced "fire-tubes" between 890 and 911, for use in connection with Greek fire; and there can be little doubt that these were a species of cannon, probably of small bore. In Spain, both Moors and Christians used artillery as early as the 12th century.

Friar Bacon was conspicuous among his contemporaries for his general learning, and we have no evidence to show whether he discovered the ingredients of gunpowder independently of foreign aid, or whether he derived the knowledge from some ancient MSS.; the latter, however, seems the more likely conclusion, as sir F. Palgrave brought to light in the Bodleian library a letter from a Spanish friar, brother Ferrarius, who was a contemporary of Bacon, in which the materials of Greek fire are detailed, differing only in proportions, and in these but slightly, from real gunpowder. That the latter was identified of old with Greek fire, is shown by the name "Crake," applied to the first cannon used. This word, which still survives in "cracker," is pointed out by sir F. Palgrave to be nothing more than a Norman corruption of "Grec." Bacon's announcement dates from 1216; but the powder of his time, as made in the west, was not readily explosive, since the materials were but roughly cleared of impurities, and then mixed together on a slab, and probably little use could be made of it as a propellant until the process of granulating had been introduced by Bertholdus Schwartz in 1320. Immediately after this discovery, cannon of small size appeared in the armory of almost every state, as if their use had been known previously, although no practical effect had been given to the knowledge, on account of the badness of the powder manufactured. These cannon generally consisted of a smaller barrel or chamber to receive the charge, which fitted into a larger one containing the projectile. It may be safely assumed that these weapons, if terrifying from their noise, were tolerably harmless—at least to the enemy—in their practice. In 1326, the Florentine republic ordered the making of iron shot and cannon for the defense of its villages. In 1327, Edward III. used "crakeys of war" against the Scotch; in 1339, 10 cannons were employed in the

siege of Cambray. By 1346, various improvements had been made; and we find in the same year the consuls of Bruges witnessing experiments by one Peter, a tinman, who had constructed a cannon with a square bore, to throw a cubical shot of about 11 lbs.; his bolt passed both walls of the town, and unfortunately killed a man on the other side. We have the authority of Villani for believing that Edward III. had three cannon at Crécy; but the cannon then made were, from the little knowledge of casting, limited to about the size of modern duck-guns, and, as has been remarked, three very inferior muskets could have had but little to do with putting 50,000 men to flight.

Up to this time European ordnance had been kept back by the rarity and high prices of sulphur, saltpeter, and iron, the last having been so scarce in England, that it was thought necessary to forbid its exportation by a statute of 28 Edw. III. Still, crude as was their form, and small their number, fire-arms had established a firm footing in Christendom; their mission of civilization, and, paradoxical as it may appear, of humanity, had begun. With the first killing discharge, the doom of feudalism had gone forth. Plated armor no longer availed against the weapon of the peasant; and the mailed chivalry, the sinews of previous battles, who had trampled with their iron heels upon popular rights, no longer could carry all before them, but, like other soldiers, were now as loath to be slain by unseen foes as the veriest villein in the host. The people discovered their powers of contending with the noblesse; by degrees, they rose for liberty, and suppressed the tyrannies of the petty lords who had long held them as mere bondsmen. In war, again, as artillery became more general, so the slaughter of battles diminished, for an army outmaneuvered was an army at the enemy's mercy, and therefore beaten; whereas, previously, in the hand-to-hand fights where victors and vanquished mixed pell mell in single combat, a victory could only be really won when there were no foes left to slay. A battle as great as that at Crécy might now be gained with a loss to the vanquished of not more than 1000 men, instead of the 30,000 who are said to have fallen victims to the English sword or bow.

Dating from the reign of Edward III., the employment of cannon and bombards in siege operations became more or less general. Froissart records that the black prince took bombards, cannon, and Greek fire to the reduction of the castle of Romozantin in 1356, but it does not appear that he availed himself of fire-arms at the battle of Poitiers in the same year. The bombards seem to have been short, capacious vessels, from which stone balls were shot with small charges to a short distance, and at considerable elevation; they were essentially the parents of the present bombs or mortars. The cannon (*canna*, a reed), on the other hand, were, for some time at least, of extremely small bore, scarcely larger than muskets of the 18th c.; they discharged leaden bullets, and would have probably been used as hand-weapons, but for their cumbrous and heavy workmanship, which necessitated small carriages. Arms of this description are doubtless those referred to as having been brought by Richard II. to the siege of St. Malo, to the number of 400 pieces, where they are said to have kept up an incessant fire day and night on the town *without* success.

In the 15th c., armies for siege operations were usually accompanied by great and small guns, the latter being intended to keep down the fire of the besieged while the large bombards were being loaded, an operation requiring no small time. These guns were gradually improved, but it was not until the reign of Henry VIII. that the founders succeeded in casting iron ordnance, to the entire exclusion, until quite the present day, of cannon formed of square or rounded bars welded together. England had even then become famous for the workmanship of its ordnance. A gun found in the wreck of the *Mary Rose*, which sunk at Spithead in the above king's reign, shows that a degree of excellence had been attained in the manufacture of artillery, little inferior to that which has lasted till our own day, when rifled ordnance are rapidly superseding cannon of smooth bores. Still, so late as Henry's reign, although great guns were found very serviceable in siege and naval operations, where the defenses of those days offered but a trifling resistance to their power, they appear to have been looked upon rather as an incumbrance than an advantage with armies in the field. This is attributed partly to the heavy character of the guns themselves, and especially of their carriages, but more particularly to the badness, or rather absence, of the necessary roads for their transport. In 1552, it is recorded in the state papers that the "kinges ordonauns [were] unable to pass over Stanes More towards Carlile."

As time passed on, the details of the manufacture were improved, the general principles remaining the same; the size of the guns increased, while the proportionate weight of the carriages diminished; limbers (q.v.) were added, and the equipage of a gun gradually perfected and lightened. With increased caliber, to which augmented range was usually added, the number of cannon—at one period enormous—taken with an army was by degrees reduced, until now a certain standard proportion between artillery and infantry is ordinarily maintained. Three guns to a thousand infantry is the proportion now considered best. Of course, this proportion differs with the opinions of various commanders; but the greatest modern generals have always acted on the maxim, that it is wasteful to send a soldier on any duty of danger which a ball can be made to perform. As a weapon of offense, Vauban doubled the utility of heavy ordnance when he applied the ricochet (q.v.) system of firing. Napoleon may almost be said to have won his battles by artillery, for he rarely, if ever, brought his infantry into action except as supports, until a way had been opened for them, or a panic caused,

by the massed fire of large batteries of guns. The duke of Wellington also devoted the greatest attention to his ordnance train; while, referring to recent events, the campaigns of lord Clyde in India were remarkable instances of the use of artillery being pushed with abundant success to its greatest limit. During the Franco-German war of 1870–71, the Prussians were considered somewhat behind the age in their use of artillery.

Cannon of widely varying bores have at different times been cast, and the various sorts became so numerous in continental armies, as at one time to cause much inconvenience from the large quantities of ammunition which it was necessary to carry. Gustavus Adolphus set the example of reducing his guns to a few standard calibers, and the same improvement was immediately adopted systematically in the French and other armies. The introduction of rifled guns of late years has limited the classes in use in the British army to the following: *Muzzle-loaders*—16-in., 80 tons; 12.5-in., 38 tons; 12-in., 35 tons; 13.5-in., 23 tons; 12-in., 25 tons ("Woolwich infants"); 11-in., 25 tons; 10-in., 18 tons; 9-in., 12 tons; 8-in., 9 tons; 7-in., 7 tons, 6½ tons, and 90 cwt.; 80-pounder of 5 tons; 64-pounder; 40-pounder; 25-pounder; 16-pounder; 9-pounder; 7-pounder (steel) mountain-gun. *Breech-loaders*—7-in., 64-pounder, 40-pounder, 20-pounder, 12-pounder, 9-pounder, 6-pounder. See CANNON, CARRONADES, GUNNERY, HOWITZER.

The mortar differs from all other guns in its solidity of form, its shortness, and its large bore. The object is the projection of shells by a more or less vertical fire, with the intention of breaking through and destroying, by weight and explosion together, roofs of magazines, public buildings, and so on, or of sinking a shell deep into earthworks of a fortress, in which it shall explode as a most deadly mine. The different sorts of mortar will be described under MORTAR. The mortar arose naturally out of the old bombard, and doubtless deviated by degrees more and more from the cannon. In very early days, we read in Arabian authors of a cylinder hewn in the rock at Alexandria, and used as a mortar. Such a cylinder, and of large size, is still to be seen at Gibraltar, where it was employed in the last siege against the Spanish, when it was made to discharge volleys of large stones, which spreading at times to a distance of 500 yards, constituted a formidable means of defense. In recent years, nearly all guns fire shells, so that the specific necessity for mortars has greatly diminished.

A gun is a frustrum of a right cone, with a cylinder (bore) removed around the axis; from which it follows that the thickness of metal is greatest at the breech, where it has to withstand the effect of ignited powder in its most condensed, and therefore most powerful state. Guns are first cast in loam or dry sand, then turned to the required shape, and lastly bored with the minutest accuracy. Formerly, they were cast with the bore already formed; but the direction was rarely exactly correct, and the surface scarcely ever strictly even. Some additional particulars of their manufacture will be given under GUN-FACTORIES, ROYAL; and the science of artillery will be summarized under GUNNERY.

An article on fire-arms would be incomplete without some allusion to the progress made in small-arms. In the 15th c., the smallest sort of cannon were probably at times mounted and used as hand-guns. From this the step to the arquebus was rapid; that weapon developed as years passed into the clumsy matchlock; that into the firelock and flint-musket; then the percussion-musket; and lastly, into the beautiful rifles of our own day, which have culminated in the central-fire breech-loaders. For diminutives, small arquebuses were made to do duty as horse-pistols; genuine pistols succeeded them: these were gradually improved and reduced in size, till they have culminated in the saloon pistol, available for a waistcoat pocket; and the deadly revolver, with its multiplied shooting power. All these weapons are described under their respective heads—ARQUEBUS, MATCHLOCK, MUSKET, PISTOL, REVOLVER, RIFLE.

Many valuable works have been written on fire-arms from the days of Leonardo da Vinci and Tartaglia to the present. Among those consulted for this article have been *Études sur le Passé et l'Avenir de l'Artillerie* of the emperor Napoleon III.; *Our Engines of War*, by capt. Jervis; maj. Straith's *Treatise on Artillery;* gen. Chesney *On Fire-arms*, etc.

FIRE-ARMS, PROVING OF (in law). In consequence of the frequency of accidents from the bursting of insufficient barrels, the legislature has made it imperative that all barrels made or imported should be regularly proved in a public proof-house. A royal charter granted in 1637 to the London gunmakers, gave them powers to search for and prove and mark all manner of hand-guns, great and small daggs, and pistols. The several statutes of 1813, 1819, and 1855, rendering the proving of fire-arms compulsory, have been superseded by "the gun-barrel proof act, 1868" (31 and 32 Vict.), regulating the duties and powers of the proof-houses in London and Birmingham (the only two in England). By this statute the forging or counterfeiting of the proof-marks or stamps is treated as a misdemeanor punishable by imprisonment for not more than two years; and a fine of £20 is imposed on any person selling or exposing for sale barrels not duly proved, or exporting or importing barrels with forged proof-marks. These penalties are to be levied on conviction before two justices or a metropolitan or stipendiary magistrate. The statute does not extend to Scotland or to Ireland, and arms manufactured for her majesty are exempted from its operation.

FIRE-BALLS are projectiles occasionally discharged from guns or mortars, for the purpose either of setting fire to, or of merely illuminating some work, against which hostile operations are directed. The usual ingredients are—mealed powder, 2; saltpeter 1½; sulphur, 1; rosin, 1, turpentine, 2½; with pitch, tow, naphtha, etc., as circumstances dictate. The use of fire-balls has, however been in great measure superseded by the introduction of rockets (q.v.), and incendiary shells (q.v.). Akin to the fire-ball, was the *fire-arrow* of ancient warfare, which consisted of tow steeped in pitch, rosin, or some inflammable mixture, wrapped round the shaft, and fired alight among an enemy's works or troops. Greek fire was also discharged in many cases on large arrows surrounded by tow and shot from *balistæ*.

FIRE-BOTE, the right of a tenant for life or years, according to English law, to cut wood on the estate for the purpose of fuel. See ESTOVER.

FIRE-BRICK. See BRICK.

FIRE-CLAY is the variety of clay which is employed in the construction of gas-retorts, glass-pots, fire-bricks, crucibles, etc., which require to withstand high temperatures. It is found chiefly in the coal measures; and the more famous kind is the Stonebridge, which is found in a bed about 4 ft. thick. It also occurs largely near Glasgow, Newcastle-on-Tyne, and in Belgium and France. The principal constituents of fire-clay are silica and alumina, accompanied by small proportions of iron, lime, magnesia, water, and organic matter, as may be observed from the following table:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
Silica	64.10	51.10	48.55	69.25	83.29
Alumina	23.15	31.35	30.25	17.90	8.10
Oxide of Iron	1.85	4.63	4.06	2.97	1.88
Lime	.....	1.46	1.66	1.30	
Magnesia	0.95	1.54	1.91		2.99
Organic Matter and Water	10.00	10.47	10.67	7.50	3.64

Fire-clay is found abundantly near and at the surface of the ground, and is readily reduced to powder by traveling wheels. When kneaded with water, and fashioned into vessels and other articles, it is dried, and is then generally subjected to a strong heat, which drives off the water and organic matter, causes the silica to unite more firmly with the alumina, etc., and leaves a more or less porous material, which can withstand very high temperatures. The Passau crucibles are merely dried, and are not fired like Hessian crucibles and other fire-clay wares. The larger the percentage of silica (sand) in the clay, the more refractory are the articles fashioned from it; and hence sand is often added to clay to increase its fusing-point and refractory powers; but a certain proportion of alumina, etc., is required to serve as a flux, to cement and hold together the particles of sand. The proportions of sand and clay are determined by the temperature to which the manufactured article is intended to be exposed; and the fire-clay of crucibles or bricks, which are serviceable at a comparatively low temperature, as in the lining of lime-kilns, would become soft, and yield in glass or porcelain furnaces.

FIRE-DAMP is the miners' term applied to light carburetted hydrogen or coal-gas when it issues from crevices in coal-mines. See GAS.

FIRE-EATING, a name usually given to a variety of feats performed by jugglers with flaming substances, melted lead, red-hot metal, etc. Evelyn, writing under date Oct. 8, 1672, thus describes fire-eating in his day: "I took leave of my lady Sunderland. She made me stay dinner at Leicester house, and afterwards sent for Richardson, the famous fire-eater. He devoured brimstone on glowing coals before us, chewing and swallowing them; he melted a beer-glass, and eat it quite up: then taking a live coal on his tongue, he put on it a raw oyster; the coal was blown on with bellows till it flamed and sparkled in his mouth, and so remained till the oyster gaped, and was quite broiled; then he melted pitch and wax with sulphur, which he drank down as it flamed; I saw it flaming in his mouth a good while. he also took up a thick piece of iron, such as laundresses use to put in their smoothing-boxes, when it was fiery hot, held it between his teeth, then in his hand, and threw it about like a stone; then he stood on a small pot, and bending his body, took a glowing iron with his mouth from between his feet, without touching the pot or ground with his hands; with divers other prodigious feats." About 1818, Signora Josephine Girardelli, who described herself as the "original Salamander," performed astonishing feats of this kind in London and other places in England. According to the accounts of her, "she commences her performances by passing plates of red-hot iron over her legs; she then stands with her feet naked on a plate of red-hot iron, and afterwards draws the same plate over her hair and across her tongue," etc. About the same time appeared in Paris, M. Chaubert, whose astonishing powers of resisting heat attracted the attention of the national institute. Among other things performed by this person, was his going into a common baker's oven, with a leg of mutton in his hands, and remaining with the oven closed until the mutton was completely dressed. Another of his performances was standing in a flaming tar-barrel until the whole of it was consumed around him. He subsequently exhibited in London.

Many of the feats of this kind are undoubtedly mere tricks, or illusions, produced by slight of hand; others are capable of scientific explanation. There is nothing more wonderful than stuffing blazing tow into the mouth—a common form of mountebank fire-eating—than in eating flaming plum-pudding, or in dipping the finger into spirits and letting it burn like a candle. It is also well known that the tongue, or the hand dipped in water, may be rubbed with impunity against a white-hot bar of iron; the layer of vapor developed between the hot metal and the skin prevents contact and produces coolness (see SPHEROIDAL CONDITION OF LIQUIDS). Such performances as those of M. Chaubert are explained by the well-known power of the living body to maintain its normal temperature for a time, independently of the external temperature (see ANIMAL HEAT.

FIRE-ENGINE, a machine employed for throwing a jet of water for the purpose of extinguishing fires. This name was formerly applied to the steam-engine. Machines for the extinguishing of fires have been used from a very early date. They were employed by the Romans, and are referred to by Pliny; but he gives no account of their construction. Apollodorus, architect to the emperor Trajan, speaks of leathern bags, with pipes attached, from which water was projected by squeezing the bags. Hero of Alexandria, in his *Treatise on Pneumatics*—written probably about 150 years before the Christian era—proposition 27, describes a machine which he calls "the siphons used in conflagrations." It consisted of two cylinders and pistons connected by a reciprocating beam, which raises and lowers the pistons alternately, and thus, with the aid of valves opening only towards the jet, projects the water from it, but not in a continuous stream, as the pressure ceases at each alternation of stroke.

Little or nothing is known as to the extent to which engines of this kind were practically used. We have accounts of "instruments for fires," and "water syringes useful for fires," in the building accounts of the city of Augsburg, 1518; and in 1657, Caspar Schott describes a fire-engine used in Nuremberg, which must have been almost identical in construction with that described by Hero. It had a water-cistern, was drawn by two horses, was worked by 28 men, and threw a jet of water, an inch in diameter, to a height of 80 feet. It was not until late in the 17th c. that the air-chamber and hose were added; the first being mentioned by Perrault in 1684, and the hose and suction-pipe being invented by Van der Heide in 1670. In England, hand-squirts were used up to the close of the 16th century. They were of brass, and contained 3 or 4 quarts of water. Two men held the handles at the sides, while a third forced up the piston. The nozzle was dipped in a vessel of water after each discharge, then raised, and the water again forced out. So clumsy an apparatus could have been but of little service in the fearful conflagrations to which our old wood-built towns were so subject.

With the addition of the air-chamber and hose, and some improvement in the details of construction, the "siphons" of Hero became the modern fire-engine. The mechanism consists of a cylindrical air-chamber; two cylinders with pistons, one of which ascends while the other descends; a pipe leading to each cylinder to supply it with water, and one leading from each to the air-chamber; and a pipe extending nearly to the bottom of the air-chamber which conveys the water to the hose.

The rising piston raises the water from the source of supply to fill its cylinder, and a valve prevents the backward flow of the water; the descending piston forces the water contained in its cylinder into the bottom of the air-chamber, where another valve is located, and thereby compresses the air. The pistons rise and descend alternately. The compressed air reacts by its elasticity, and pressing upon the surface, forces the water through the hose. In the space above the surface of the water, the whole of the air that formerly filled the chamber is supposed to be compressed. Assuming this to be one third of its original bulk, its pressure will be about 45 lbs. to the sq. in., and this pressure will be continuous and nearly steady, if the pumps act with sufficient force and rapidity to keep the water at that level. As air may be compressed to any extent—and its elasticity is increased in exactly the same proportion—the force that may be stored in the compressed air is only limited by the force put upon the pumps, and the strength of the apparatus.

Under proposition 9 of the same work, in which "the siphons used in conflagrations" are described, Hero describes and figures the air-chamber as "a hollow globe or other vessel, into which if any liquid be poured, it will be forced aloft spontaneously and with much violence, so as to empty the vessel, though such upward motion is contrary to nature. The globe is represented with a single piston attached for compressing the air. Thus, about 1800 years elapsed before proposition 9 and proposition 27 of this work were put together for so obvious and useful a purpose as the fire-engine, although the book was tolerably well known to the mathematicians of the period; and when they were put together, it was probably done by a practical man, who had never heard of the name of Hero.

The more recently constructed fire-engines include contrivances for preventing the entrance of mud and gravel, and for getting readily at the valves in case of their being out of order, while the cistern is dispensed with, a hose being carried directly to the water-supply. They are usually drawn by two or four horses, though smaller engines are made to be drawn by hand or by one horse. The hose is of leather, fastened

by metal rivets, instead of the sewing formerly used. In the United States, cotton is woven into a tube by machinery constructed for the purpose. Two such tubes are fitted one within the other, and held together by a solution of India-rubber, which, on consolidating, forms a water-tight layer.

The fire-engines of the London fire brigade establishment have usually 6-in. barrels with 7-in. stroke, and throw about 70 gallons of water per minute. Their weight, with implements, firemen, and driver, is about 30 cwt. These are found more convenient for general purposes than larger engines, as they can be drawn at a gallop by two horses for a distance under six miles. Four horses are used for greater distances. When a large engine is required, two of these may be joined together, and throw 180 gallons per minute. The pumps are worked by levers, with long horizontal bars attached, to enable a number of men to work together upon the same pumps. Many larger engines than these have been constructed, and steam has been successfully applied. The first application of the steam fire-engine was made when the Argyle rooms in London were burned in 1830. Several floating fire-engines for conflagrations near the Thames have been constructed and worked by steam; one of these is capable of throwing 1400 gallons per minute. A floating engine was used with considerable effect when the houses of parliament were burned; but at the fire of the warehouses near London bridge (1861), the fury of the combustion, when at its maximum height, was so great, that the combined efforts of all the London engines, whether worked by steam or by hand, had no perceptible effect in subduing it. For all ordinary fires, the hand-engines above referred to are the most useful, as they can be brought to the spot and set in action immediately. Nevertheless, so greatly have the steam fire-engines been recently improved, that steam of 100 lbs. pressure on the square inch can be raised in seven minutes after making the fire.

It has been questioned whether, in cases of very intense combustion, a comparatively small stream of water has any subduing effect at all—some assert that it may even increase the conflagration. Various chemical liquids have been proposed as flame-extinguishers; but plain water is still the only power used to any extent.

Fire-Brigades.—For working fire-engines, a body of *firemen* are required. The fire insurance companies formerly had separate establishments of fire-engines and firemen; but in 1825 some of them united, and by 1833 all the important companies combined, and the London fire-brigade was formed, under the management of the late Mr. Braidwood, whose death in the discharge of his duties at the great fire just referred to was justly deplored throughout the country as a national loss. In 1865, an act of parliament empowered the metropolitan board of works to purchase the engines and appliances of the London fire-brigade establishment; to secure the services of the brigade men; to construct additional engines and stations; to map out the metropolis into convenient districts; and to cause the firemen to act in harmony with a salvage corps and a fire-escape corps. The engines now used are very powerful; the manual engines are for 22, 26, 30, 38, and 46 men each; while the steam fire-engines, especially those constructed by Messrs. Shand and Mason, on a principle patented in 1870, will throw a jet to a vertical height of 180 ft., or drive water through half a mile of pipe horizontally. At a fire in the East India docks in 1866, the steam fire-engines poured in the enormous quantity of 3,000,000 gallons. At the great fire in London, in June, 1873—that of the Alexandra palace—a powerful force of engines was present, but there was insufficient water to render them effective. The establishment comprises about 400 firemen, 55 stations, 90 manual engines, and 35 steam-engines (5 of them floating). As the metropolitan board in London pay a fee to the first person who gives notice of a fire at the engine station, there is always a supply of volunteers from among cabmen and people in the streets, besides policemen, to perform this important service; and in like manner the pump-bars of the fire-engines are always fully manned. The men of the brigade wear a uniform, with strong helmets and metal epaulets, to protect them from the blows of falling beams, etc. The courage and skill of the men in making their way through and about burning buildings, for the purposes of directing the steam from the hose, or for saving life and property, and the general efficiency of the whole organization, are worthy of the highest praise. The water-supply in London is not so well managed as the engine-supply, thereby frustrating the exertions of the firemen.

Most of our provincial towns now have a fire-brigade upon the same model as that of London. The fact that Paris has several times as many firemen as London, is a tolerable proof of the amount of work the London firemen are called upon to perform. At Paris, as on the continent generally, the fire-engines and firemen are under government control; and the *sapeurs pompiers*, or firemen, are empowered to enforce the assistance of any people they can find in the streets.

In many continental towns, fire-watchmen are stationed in commanding situations, such as church-towers; and their duty is to ring a fire-bell, or otherwise give the alarm, immediately upon observing a conflagration. The fire-companies of the United States are composed of volunteer firemen, who receive no pay, but certain immunities from taxation and militia service. Their annual parade-day is quite a fête. Each company has a special uniform; and in some cities the rivalry among them is so great, that they frequently have desperate fights for the best "location" for their engines. Prizes are awarded to those whose engines throw a jet of water to the greatest height. An admira-

ble system of electro-telegraphy has been adopted, to give notice from station to station in the event of fire. Nevertheless, American conflagrations are often frightfully destructive: witness those at Chicago in 1871, and at Boston in 1872 and 1873.

In Constantinople, there are two fire-towers, one on each side of the golden horn, with watchmen continually stationed there. A large wicker-ball is hauled up to the side of the tower as a signal, and the cry of "There is a fire at Scutari, Tophané," or whatever be the quarter of the city in which it occurs, is raised and taken up by the patrol, who strike the pavement with their iron-bound staves as they repeat the cry. In a few minutes, the alarm is thus spread throughout the whole city.

FIRE-ENGINE (*ante*), some form or combination of forcing pumps for throwing a stream of water to extinguish a fire. A fire-engine with two pumps, and worked by levers or brakes, was invented in Egypt in the 2d c. B.C. For centuries the chief device for extinguishing fires was the hand syringe or "squirt." In England its use was discontinued for a long time, leathern buckets, ladders, and crooks taking its place; but was revived near the close of the 16th century. Specimens of the "hand-squirt" are still preserved in London as curiosities. It seems probable that a rude sort of engine was also used in London at a very early day. In Germany, huge syringes, mounted upon wheels, were in use in 1618. Paris had fire-engines of some sort at the beginning of the 18th century. In England, in 1734, engines of various construction were manufactured, the most successful of which was that invented by Newsham. Two of his machines, the first invention of the kind ever used in this country, were introduced in New York in 1731. It was more than fifty years after this that the leather valves within the cylinders were superseded by metallic valves, placed in valve-chests apart from the cylinders and the air-chamber. Rotary and semi-rotary pumps were also introduced, and are still used to some extent in London. Floating fire-engines worked by hand were used on the Thames before the close of the 18th century. In some cases the mechanism that worked the pumps was used to move the paddle-wheels. It was not until 1850 that floating fire-engines worked by steam came into use in England. An engine of this sort has done good service for years on the North and East rivers around New York. The first steam fire-engine is believed to be that made by Braithwaite in London in 1829. Ericsson built one in New York, about 1840, similar to Braithwaite's; and Latta, in Cincinnati, produced, in 1850, the first machine which was practically useful. Cincinnati was the first city in the United States to organize a steam fire department, but other large cities and towns rapidly followed the example. The steam fire-engines now in use may be classified as having reciprocating pumps without fly-wheels, reciprocating pumps with fly-wheels, and as rotary engines. The Amoskeag company (Manchester, N. H.) builds a very effective engine, which by a simple addition is self-propelling; a pole may also be attached, that the machine may be drawn by horses. The fly-wheel shaft is provided with a pulley, from which a chain connection furnishes motive power to a larger pulley in the back driving-axle. The pulley on the fly-wheel shaft may be disconnected when the engine is pumping. On the road the engine is steered by a large wheel upon an upright shaft in front of the driver's seat; a pinion on the lower end of this shaft works in a horizontal gear-wheel, controls the front axle, and guides the machine. There is a differential gear by which one of the hind wheels may travel faster than the other when going round a curve. When standing in the engine-house, steam is maintained in a self-propelling engine, at about 80 lbs.; in steam-engines drawn by horses, at about 51 lbs.; this is done by attachment to a stationary boiler in the engine-house, fuel being laid in the furnace of the engine, to be ignited when leaving the house. See FIRE.

FIRE-ESCAPES. An immense number of contrivances have been at different times proposed for enabling people to escape by windows and house-tops from burning buildings. They are of two distinct kinds—one for affording aid from outside, and the other for enabling those within the house to effect their own escape. Of the latter, the

simplest is a cord that should be firmly attached to the window-sill of every sleeping apartment, and coiled up either in a box on the floor, or under a dressing-table, or other suitable place. A rope one quarter or three eighths of an inch thick, and knotted at intervals of about a foot, is well adapted for the purpose. A good quarter-inch sash-cord will support from 3 to 4 cwt., or more if new, and will cost from 6*d.* to 2*s.*, according to the height of the room. A man with tolerable nerve may let himself down by means of such a cord, either by placing his feet against the wall and bringing "hand over hand" down upon the knots, or by clinging with his feet and knees to the rope as well as with his hands. A man may let down a woman or child by means of a sack at the end of the rope, or simply by fastening them to the end, and letting the rope pass through his hands, aided if necessary by the friction of the window-sill, if it be allowed to bend over it. A rope coiled upon a drum inside a dressing-table, with a winch-handle to uncoil it, is another form. A pulley fixed to the window-sill, over which runs a rope with a chair or simple board to sit on, is a well-known contrivance.

Some means of escape from every sleeping-room should be provided, and the inmates should be thoroughly prepared by knowing beforehand how to act in case of a fire cutting off communication with the usual means of outlet. In a row of houses with projecting balconies, a board of sufficient length to reach from the balcony of one house to the next may be kept in each room, or even a rope might be thrown across with the aid of a stone or lump of coal, etc., tied to one end. An exit by the roof or from the window on to the parapet affords a ready means of escape from a top story, and should always be provided in tall houses. In case of emergency, when no provision has been made, the cord holding the sacking of the bedstead may be undone, or the bedclothes and curtains tied together to form a rope; or as a last resource, the bedding may be thrown out of window to form a cushion to alight upon in case of the cord or bedclothes being too short to reach the ground; or if there be no time to extemporize such cordage, and it should be necessary to drop directly from the window, in this case, it would be better to hang by the hands from the window-sill and then drop, than to jump direct, as the height of the fall would be somewhat diminished thereby. In all such cases, presence of mind and coolness is of the utmost importance, and may render very simple and slender means of escape more effectual than the most complete and elaborate would be without these qualities; and presence of mind may be to a great extent acquired chiefly by being mentally prepared, and, if possible, by rehearsals of what should be done in case of danger.

Fire-escapes to be used from without, consist either of simple ladders kept in churches, police offices, or other convenient stations, or a series of ladders that can be jointed together; of poles with baskets attached; of ropes with weights at one end, that they may be thrown or shot into windows; of combinations of ladders, ropes, bags, baskets, nets, etc. The fire-escape now generally adopted by the society for the protection of life from fire, is a light carriage or frame-work on wheels, to which a series of ladders, etc., are attached. It is thus described by the society: "The main ladder reaches from 30 to 35 ft., and can instantly be applied to most second-floor windows by means of the carriage-lever." This projects on the opposite side to the ladder like the shafts of an ordinary carriage, and works upon the axle of the wheels as a fulcrum. "The upper ladder folds over the main ladder, and is raised into position by a rope attached to its lever-irons on either side of the main ladder; or, as recently adopted in one or two of the escapes, by an arrangement of pulleys in lieu of the lever-irons. The short ladder for first floors fits in under the carriage, and is of the greatest service. Under the whole length of the main ladder is a canvas trough or bagging made of stout sail-cloth protected by an outer trough of copper wire net, leaving sufficient room between for the yielding of the canvas in a person's descent. The addition of the copper wire is a great improvement, as, although not affording an entire protection against the canvas failing, it in most cases avails, and prevents the possibility of any one falling through. The soaking of the canvas in alum and other solutions is also attended to; but this, while preventing its flaming, cannot remove the risk of accident from the fire charring the canvas. The available height of these escapes is about 45 ft.; but some of them carry a short supplementary ladder, which can be readily fixed at the top, and which increases the length to 50 feet."

This society has upwards of 120 of these fire-escapes stationed in different parts of London. They stand in the roadway, and are each under the charge of a conductor during the night. Almost every house in London is within two or three minutes' run of one of these. Since 1836, when the operations of the society first commenced, they have saved thousands of lives. At one fire, nine lives were saved by one man and fire-escape. Fire-escapes of similar construction are now stationed in some of our provincial towns. When required, they are run to the burning house, the main ladder standing nearly upright all the while. It is then directed to the required window at a considerable inclination, and the attendant ascends the ladder, and helps the inmates either to descend by it, or if they are unable to do this, he lets them down by the canvas trough, which forms an inclined plane, along which they may easily and safely descend with the aid he is enabled to afford them.

FIRE-EXTINGUISHER (FIRE-ANNIHILATOR, *ante*), an apparatus for extinguishing fires by pouring upon them water surcharged with some substance of an anti-com-

bustible nature. The substance chiefly employed for this purpose is carbonic acid gas, the conveniences for generating which, for use at the moment it is wanted, are various. The ordinary fire-extinguisher is a cylindrical vessel, holding about eight gallons; it is made to be strapped to the back, and provided with a short hose and nozzle, through which a stream of considerable force may be discharged. The cylinder is filled with water, and within are two small vessels, one containing a bicarbonate, the other a strong acid. When the apparatus is to be used, the contents of these vessels are emptied into the water, and the carbonic acid, set free by chemical action, is taken up by the water. The pressure created by the confined gas forces out the liquid in a strong jet when the passage is opened. The gas, in coming in contact with the flames, assists in extinguishing it by excluding the atmospheric air. For subduing a fire in its first stages this contrivance is often very effective. The first apparatus of this kind ever brought into successful use was made in London in 1816. The contrivance for generating the gas was slightly different from that above described, although the principle was the same. Within the last 12 or 15 years various methods of charging the water in the cylinder have been devised. The Babcock extinguisher is filled with a solution of bicarbonate of soda, in which is suspended a vessel of acid, which is made to tilt over and discharge its contents into the solution when the stopper is withdrawn, thus freeing the carbonic acid. Use has also been made of salts in solution, which, as the water evaporates, are left incrusting the substances in combustion, thereby excluding the air, or, failing in this, giving off incombustible gases. Large cylinders filled with chemicals in the manner above described have been mounted on wheels, and, known as chemical fire-engines, have been used to some extent, but they are valuable only in the earliest stages of a fire. Various methods have been proposed for securing the automatic action of the fire-extinguisher through the increased temperature caused by fire, but they have not been very successful. An important adaptation of the fire-extinguisher has been applied to sea-going ships. A series of pipes on the upper deck communicate severally with various compartments of the hold, the coal-bunkers, the main deck, etc. The chemical agents are placed in a box, to which steam also may be admitted; when in action, the steam mingles with the carbonic acid and the two are conveyed to the place of danger, where they take the place of the air, smother, and finally extinguish the fire. The steam pipes are perforated along their sides that the distribution may be complete and positive. A system of distributing water, as in a planing mill or other factory, consists of an extended system of pipes placed near the ceiling of the different rooms and connected with a central supply, which may be a tank near the roof, or a pipe from a powerful engine. The distributing pipes are perforated with many small orifices, so small as to deliver the water in spray. If an alarm comes from a given room, the supply of water is turned to that room, which is instantly filled with spray.

FIRE-FLY, a name common to all winged luminous insects, at least to all that possess much luminosity. Except the lantern-fly (q.v.), they are all coleopterous, and belong to two nearly allied tribes, *lampyrides*, to which the glowworm (q.v.) also belongs, and *elaterides*, to which belong our skipjack beetles, and of which the larvæ are too well-known to farmers as wire-worms. The male glowworm, which alone is winged, has too little luminosity ever to receive the name of fire-fly, but the fire-flies of the s. of Europe (*lampyris italica*) and of Canada (*L. corusca*) are nearly allied to it. See GLOWWORM. Fire-flies are only seen in the most southern parts of Europe. They abound in almost all the warmer parts of the world, and the brilliancy of the spectacle presented by them when glancing about in numbers amidst the darkness of night, has been often described with enthusiastic admiration. Mr. Gosse says of the Canadian fire-fly: "The light is of a yellow color, very different from the blue gleam of the English glowworm: from this circumstance I at first took them for candles in the woods, and though told what they were, at every one that appeared, the same idea would come across my mind. . . . They more frequently give out the light while flying, than when crawling or resting, though we may often observe the intermittent gleam as one crawls up a stalk of grass, or rests on the leaf of a tree. They fly slowly, and as they fly, emit and conceal their light with great regularity at intervals of two or three seconds; making interrupted lines of light through the air, gleaming slowly along for about a yard, then suddenly quenched, and appearing again at the same distance ahead. The insect is a pretty beetle, with soft elytra, of a light-brown color, marked with red, and handsomely striped; the light proceeds from the last three segments of the abdomen, which are of a delicate cream color by day. At night these three segments are bright at all times; but at the regular intervals I have mentioned, they flash out with dazzling splendor. If this part be plucked off and crushed, many patches of brilliance occur for a few moments among the flesh, but they gradually die away." He further describes those fire-flies as appearing in great numbers in summer evenings, over wet and marshy ground, millions of them above a river, or over the surface of a large field, like stars on a clear winter night, but flashing and disappearing, and moving about in mazy evolutions.—But still more brilliant are the fire-flies of more tropical regions, belonging to the tribe *elaterides*, as the fire-fly of the West Indies (*elater noctilucus*), which gives out its light chiefly from two eye-like tubercles on the thorax. The light is so powerful, that the smallest print may be read by it; and this becomes quite easy if a few of the insects are inclosed in a small glass vessel. They are not

unfrequently employed—particularly in St. Domingo—to give light for household purposes; and they are used for purposes of decoration on festival-days by women, who attach them to their dress or to their hair. One which had been accidentally brought alive to Paris, once astonished and alarmed the Faubourg St. Antoine. These insects are caught in some parts of the West Indies—a torch being used to attract them—and brought into houses to destroy mosquitoes, which they eagerly pursue and devour. See LUMINOSITY OF ORGANIC BEINGS.

FIRE INSURANCE. See INSURANCE, *ante*.

FIRE ISLAND AND BEACH. Fire Island, or rather "the fire islands," in the last century, consisted of three very small uninhabited islands in the Great South bay of Long island. They were but a few acres in extent, and at high tide were almost submerged. "Fire island" now means the low, sandy spit of land, about 30 m. in length, which separates the larger portion of Great South bay from the Atlantic ocean. At its western end is Fire Island inlet, near which there is a lighthouse of the first order. The beach near the w. end is a place of summer resort for considerable numbers of people. On this beach Margaret Fuller Ossoli, with her husband and child, perished by shipwreck, July 16, 1850.

FIRELESS ENGINE, a form of steam or vapor engine which is detached from the heating apparatus. Dr. Emile Lamm, of New Orleans, invented an engine in which the motive power was derived from the vapor of ammonia. The ammonia, as it escaped from the engine, was passed into a reservoir of water, in which it was absorbed; the water when heated to a temperature of about 135° F., gave up the ammonia as gas, which was returned to the engine to be used over again, and then again absorbed and returned as before. This engine was found efficient and economical for the movement of street cars. The use of ammonia was soon abandoned, steam taking its place. Water heated to 212° F. becomes vapor, if the pressure upon it be no more than the usual atmospheric 15 lbs. per sq. inch. If the pressure be greater, the water remains liquid until a higher temperature is reached, the temperature varying with the pressure according to well-known laws. If steam at a high pressure be admitted to water of low temperature and pressure in a closed vessel, the steam will be condensed in the water, but the pressure in the vessel will be increased, while the volume of the water will be enlarged by the volume of that derived from the condensed steam. The water thus becomes charged with steam condensed under high pressure, and when the pressure is relieved, a portion of the steam reverts to its condition of vapor, and may be conducted in the usual way to a cylinder and piston, where it will do its customary work. The opening of the valves gives vent to the vapor, gradually reduces the pressure, and relieves the condensed steam; so that a tank, filled with water and stored with many times its volume of uncondensed steam, will furnish motive power sufficient to move the engine and a considerable train of cars for a trip of several miles. On its return, the tank is connected with a stationary boiler from which it receives a fresh supply of steam. It will not be forgotten that the real force of the steam is due to the heat which it contains, and that if the heat be lost, by radiation or otherwise, from the tank containing the condensed steam, its potential energy is so much reduced.

In applying these principles, the mechanism is that of an ordinary locomotive minus its fire-box, having a water-tank instead of a boiler; the appliances for stopping, starting, and backing, are as usual. The tank may be about 6 ft. long, and 3 ft. in diameter, covered thickly with felt and wood to retain its heat. Steam is taken until the gauge indicates 135 to 150 lbs., the temperature for 135 lbs. being 353°. With this accumulation of power the machine will run 5 to 7 m. before the pressure is reduced to 60. lbs. The labor and care of firing is avoided on one of these engines, but in other respects they require the same skill needed in the common locomotive. The fireless engine has been used in several large cities, but does not seem to commend itself to practical men.

FIRE'LOCK, the name applied on its introduction, in 1690, to the old musket, which produced fire by the concussion of flint and steel, to distinguish it from the *matchlock* previously in use, which had been fired by the insertion of a lighted match at the powder-pan. Writers of the earliest part of the 18th c. called firelocks "asnaphans," a word obviously corrupted from the Dutch *snaphaan*, and leading to the inference that they were brought to England by William III. and his Dutch auxiliaries. Their first invention is, however, involved in obscurity. The weapon was superseded before 1830 by the percussion musket; which, in its turn, has now yielded to the rifle (q.v.).

FIREMAN'S RESPIRATOR, invented by Dr. Tyndall. It is a combination of his own respirator of cotton wool moistened with glycerine, and Dr. Stenhouse's charcoal respirator. With this protection a man can remain a long time in the densest smoke.

FIRENZUOLA, ANGELO, an author distinguished for the Attic choiceness of his language, was b. at Florence in 1493. Having completed at Perugia the studies which he commenced in Florence, he proceeded to Rome in anticipation of a brilliant legal career, but shortly abandoned the eternal city, disappointed in hope and shattered in health. It seems well authenticated, that he finally enrolled himself among the monkish brotherhood of Vallombrosa, and rose to considerable influence, in spite of the extreme license of morals and licentiousness of writing for which he was noted. The date of his death

is doubtful, but it is generally placed between 1542 and 1544. His chief works are a spirited paraphrase of the *Golden Ass of Apuleius*—in which he is generally considered by his countrymen to have far excelled the original in nerve and beauty of language; *I Discorsi degli Animali*—containing some sound lessons of just legislation to the ruling powers, the censure being skillfully veiled by means of his animal orators; *I Ragionamenti*, a work in close imitation of the *Decameron* both as regards the impurity of sentiment, and classic purity of language; *Il Trattato della bellezza delle donne*, an eulogistic discussion concerning the charms of the gentle sex, to whom he was inordinately devoted. His works were published in Florence after his death. The best edition is that of Florence (1763, 3 vols.).

FIRE-POLICY. See INSURANCE.

FIRE-PROOF BUILDINGS. The problem of constructing warehouses, dwelling-houses, etc., that shall be proof against all risk of conflagration, has not yet been solved. The liability to conflagration may be greatly diminished by the construction of a building, but cannot be entirely averted; and therefore, in all "fire-proof" buildings containing furniture or other combustible materials of any kind, the ordinary precautions against fire should be strictly observed. It is well to state this at the outset, as, unless it be understood, a so-called fire-proof building may be more dangerous than an ordinary one, especially in warehouses, etc., intrusted to the care of watchmen and others, who, relying upon the supposed immunity the name expresses, are liable to neglect many precautions they would not fail to observe in a building believed to be dangerous. The most destructive fire that has occurred in London since 1666 was that at Cotton's wharf, in 1861, the warehouses of which were what is called "fire-proof." The great fury of this conflagration depended on the nature of the goods that were stored. It is scarcely possible to believe that such combustibles as tallow, turpentine, etc., could have been stored in the vicinity of saltpeter, unless there had existed some faith in their practical isolation from each other by the fire-proof divisions of the building, as it is so well understood that saltpeter, though incombustible of itself, intensifies to an immense extent the combustibility of all combustibles, by supplying them with undiluted oxygen when heated in contact or within a moderate distance of them.

The nearest approximation to fire-proof construction may be obtained as follows: The walls should be of stone or brick, and any ties, lintels, etc., required in the construction should be of iron. The staircases should be of iron or stone, and the floors or landings of tiles, concrete, or stone. Wherever wood is inevitably used, it should be prepared with silicate of soda (see FIRE-PROOFING). Instead of wooden joists to support the floors of each story, arched stone or brick work should be used, and this should be put together with sufficient care to be independent of the mortar. The roof should be constructed in like manner, wooden rafters being entirely excluded. The doors should be of iron, and the security would be much increased if the doors between any two apartments containing combustible materials were double, with a space between them equal to the thickness of the walls. Of course, it is not practicable to carry out all these precautions in a dwelling-house, but the danger from fire may be considerably diminished by attending to some of them. Wooden staircases are especially dangerous. The most important conditions for a warehouse are, that each apartment shall be separated from the next by stout walls of non-conducting materials, and more especially, that each shall be as nearly as possible air-tight; and whenever, from the nature of the goods, ventilation is required, it should be obtained by periodically opening the doors and windows. If this latter condition is fulfilled, any fire would extinguish itself, unless there be along with the combustible goods some oxygen-giving substance, such as saltpeter, chlorate of potass, or other nitrates or chlorates.

At first sight, it may appear that a warehouse built entirely of iron would be effectually fire-proof, but this is far from being the case. In the first place, iron conducts heat more readily than any other material used in building; secondly, cast-iron is liable to crack and split when suddenly heated or cooled. Iron supports may, under some circumstances, be even more objectionable than wood, for if the water from a fire-engine were to play upon a heated cast-iron girder, it would probably give way immediately, while a stout wooden beam might be extinguished before being burned through. When buildings supported by iron girders are burning, they are far more dangerous to firemen than those with wood, as the experienced fireman can form a pretty accurate judgment of the time that burning wooden beams will stand, and may move about in their vicinity to direct the stream of water to where it is most needed, but iron girders split and fall without visible notice. It is on this account that floors of arched masonry are recommended above. In great fires, the heat is sufficient to fuse iron.

Without going to the expense of making warehouses and manufactories absolutely fire-proof, certain precautions not of a costly nature might be usefully adopted, for the purpose of merely checking the progress of conflagration until the arrival of fire-engines. Among these simple measures, may be included iron doors hinged on stone between different departments: a sufficient deafening not easily destructible between the ceiling of one story and the floor of that above; and stone stairs. For rendering timber difficult of combustion, see FIRE-PROOFING. See also SAFES, FIRE-PROOF.

FIRE-PROOF BUILDINGS (*ante*). Many attempts have been made to construct buildings in such a manner and of such material as to make them indestructible by fire, but they have been only partially successful. It is easy to employ incombustible materials in the construction of walls, floors, stairways, doors, etc.; but it is not so easy to make them proof against disintegration from intense heat and the application of water. In the great Chicago and Boston conflagrations it was found that walls of granite, brick, and marble, which no fire could consume, crumbled into ruin under the combined influence of fire and water, and so were no barrier to the progress of the flames. The fire could hardly have made its way more rapidly or surely if all the buildings in its path had been of wood. Hard-burned bricks no doubt make the safest walls and partitions, while ceilings and floors of the same material laid in cement are as nearly indestructible by fire as anything that the ingenuity of man has invented. It was thought at first that iron buildings would be proof against fire; but the iron girders, beams, and posts, though they cannot be consumed, are so expanded and bent under the influence of heat as to be rendered useless for supports in time of a fire. No doubt a building may be so constructed that a fire in one of its rooms may destroy what is combustible therein, without going any further and without endangering the building itself; but if it is contiguous to other buildings in conflagration, its walls must be very hard and thick to resist the power of the flames, while they can hardly protect anything within that is combustible, for the fire will make its way through doors or windows, unless extraordinary precautions have been observed. Many brick walls fail to resist fire on account of defective mortar, which crumbles from heat, causing them to deflect and fall. Wood, well pugged with cement, is strongly recommended by many architects as preferable to iron for girders and beams, but unless the cement is of the best quality, it will afford little protection. In London, safety is sometimes sought in arrangements for flooding buildings with water through pipes constantly connected with a reservoir; but in many cases this would afford but slight protection. The system of pugging wood with cement for light structures is in common use in Paris. Oak timber, on account of its hardness, is chiefly used for this purpose. The framework, made in the ordinary way, is battened with oak inside and outside, the battens being only a few inches apart. The space between the two series of vertical battens is filled with burnt clay, chips of stone, or broken brick, and then the surface on each side is coated with plaster of Paris, completely filling the interstices, covering the wood, and making a hard, smooth wall, impervious to fire to a certain extent, but liable to crack and fall away under the influence of great and protracted heat. The ceilings and floors are also battened and protected in the same way. It is difficult to isolate the different stories of a building from each other on account of the openings for hoistways and stairways; but this has been effected in some cases—notably in that of the book-warehouse of Harper & Brothers in New York—by putting the stairways outside the walls. Mansard roofs have been made less dangerous by the use of iron instead of wood to support the slate. Floors now are sometimes made fire-proof by clay bedded upon a metal support. But none of these devices, nor any others thus far adopted, afford absolute protection, under all circumstances, against the invasions of fire.

FIRE-PROOFING. Attempts have continually been made to render cotton, linen, and other textile fabrics, timber, etc., incombustible; but at present they have been but partially successful. There are many means by which fabrics may be prevented from flaming, their combustion being reduced to a slow smoldering; and the many cases of fatal results from the extravagant dimensions of ladies' dresses (crinoline) rendered the adoption of some such protection against fire very desirable. By moistening the fabric with a solution of any saline substance, which, upon drying, will leave minute crystals deposited in or between the fibers, its inflammability will be greatly diminished, but the salt imparts a degree of harshness to the fabric, and in many cases weakens the fibers. Alum, sulphate of zinc, and sulphate of soda have been used, and are effectual to prevent flaming, but they weaken the fiber. Common salt does the same. Phosphate and sulphate of ammonia are less objectionable on this account, but the former decomposes by contact with the hot iron in ironing. Tungstate of soda has been proposed, and is said to have no injurious effect on the fiber. Sulphate of ammonia, chloride of ammonium (sal ammoniac), and borax, are among the best fitted for domestic use, though they are not unobjectionable. For made-up clothing, borax is, perhaps, the best, and it is most effectual in its action, and is the least injurious to the appearance of the article, though it is stated to have some weakening effect on the fiber; this, however, is only perceptible in case of a tearing strain, and will not perceptibly damage such articles as ladies' underclothing, or anything else only subject to ordinary wear. Wood has been treated in a similar manner. Milk of lime, alum, sal ammoniac, sulphate of ammonia, chloride and sulphate of zinc, sulphuret of lime and baryta, etc., have been used, and its *inflammability*, but not its *combustibility*, is destroyed. Like the fabrics, when similarly treated, wood smolders slowly. The most efficient protection to wood is silicate of soda. If planks of moderate thickness be brushed three or four times over, on each side with a strong solution, they are rendered almost incombustible; they will only burn when very intensely heated. The silicate fuses and forms a glass which envelops the surface, and even the internal

fibers of the wood, if it be sufficiently saturated, and thus seals it from the oxygen of the air.

FIRE-PROOF SAFES AND REPOSITORIES are used as receptacles for deeds, paper money, account books, and other valuables. They are now regular articles of commerce, and are to be found in almost every counting-house, lawyer's office, jeweler's or watchmaker's shop or warehouse, and are indispensable to banking and such-like establishments. Our forefathers used oaken chests secured with iron straps and studs for similar purposes. That which formerly contained the crown jewels of Scotland, and is still exhibited in Edinburgh castle, is a good example. Subsequently, iron chests made simply of stout cast or wrought iron were used. The modern safe has double walls and doors of stout iron plates, and the space between the plates is filled with some substance that shall resist the transmission of the heat, which would be readily conducted through solid iron. The materials used for these linings are very various—sand, dried clay, charcoal, ashes, bone-dust, alum, gypsum, etc. The safes of Messrs. S. Mordan & Co., which are largely used by bankers, are lined with a mixture of equal parts of sawdust and alum. Some makers include small vessels containing liquids; the vessels burst when heated, and the liquids exert some cooling effect. Alum acts in nearly the same manner. It contains 24 equivalents of water, or nearly half its weight. At 212°, ten equivalents are driven off in vapor; at 248°, ten more; and at 392°, the four remaining equivalents are volatilized. It is a mistake, however, to suppose that any of these linings can render such a safe really fire-proof; and this is admitted by the more scrupulous manufacturers, who carefully abstain from using the designation of "fire-proof," but apply that of "fire-resisting," which honestly describes all that they are capable of doing, as they may resist the action of fire for a considerable time; but whether or not their contents may be ultimately preserved from a fire, is simply a question of the duration and intensity of the heat to which they are exposed. Their great weight in some cases assists in preserving them, especially when on an upper floor, as such a safe would be the first thing to break through the burning joists and descend to the lower part of the building, where the fire is usually the most smothered. These safes are sometimes let into recesses of stout masonry, built on purpose, and protected by an additional double iron door. This, of course, adds greatly to their security. All such safes should of course be secured by the best locks that can be made, protected by every possible precaution against picking, blowing up by gunpowder, or other violence. See LOCK, and SAFES, FIRE-PROOF.

FIRE-PROOF SAFES AND REPOSITORIES (*ante*), receptacles for things of value, so constructed as to protect them from fire, even though the building in which they are should be utterly destroyed. Such a safe may be described as an iron strong-box, lined with some fire-resisting medium. It is claimed that the idea of such a structure originated in this country with Mr. James Conner, type-founder, of New York, somewhere about 1833, and that he carried it into effect by placing a safe lined with plaster of Paris in his office. His invention was not patented, however, neither was its value tested by fire, and it was thrown aside after a few years. In 1843, a Mr. Fitzgerald took out a patent for the same or a similar invention. Nine years before this, however, William Marr patented in England a method for constructing a fire-proof safe. In the space between the inner and outer walls of his structure, Marr placed sheets of mica pasted upon paper, and then packed the space full of either burnt clay and powdered charcoal, or powdered marble. Since 1843, both in this country and in England, the invention, in one form or another, has come into general use, and different inventors have busied themselves with improvements. Charles Chubb, of London, used baked wood-ashes for filling; Thomas Milner, of Liverpool, inclosed one, two, or more inner cases, with spaces between for some absorbent material, in which were placed vessels, pipes, or tubes filled with an alkaline solution, or any other matter evolving steam or moisture, to be discharged into the surrounding absorbent materials on exposure to heat or fire; other English inventors filled the inner spaces with ground alum, finely sifted, and finely pulverized gypsum, mixed together, heated to liquefaction, and forming when cool a brittle substance, which was comminuted into a fine powder; later still, another English inventor used powdered alum and sawdust for filling. The material upon which we must chiefly depend for making a safe fire-proof is water, so placed that it may be liberated as steam, since nothing can burn in a safe when its filling furnishes steam at 212° F. It is also important that the supply of steam may be continued through a protracted fire—that the material may retain its water until required by heat—and that in ordinary use the safe may be free from dampness. Safes have been built to contain pipes or cans full of water, to be set free on the melting of some easily fused metal. Substances which contain water in their chemical composition are more serviceable, alum being a notable example. Among materials used for filling safes are soap-stone, alum alone or with plaster, clay, or paper pulp, gypsum with copperas, or asbestos, tiles, raw cotton, sawdust and whiting, hydraulic cement, etc. Herring's safe is filled with double sulphate of lime, the residue of soda-water manufacture. It is dry and changeless at common temperature, but gives off carbonic acid at 1000° F., the temperature of red-hot iron. Plaster of Paris and alum

are also used for the water which they contain, and the filling, when heated, furnishes a compound of carbonic acid and steam.

FIRE-RAISING, in the law of Scotland, is the equivalent term for arson (q.v.) in England. If any part of a tenement, however small, has been set fire to willfully, this crime has been committed. It is quite indifferent where the fire has commenced, and the offense is frequently perpetrated by setting fire to furniture, or to other objects either within or without a house; but it is not regarded as completed, and is punished as a separate crime, of which we shall speak afterwards, unless the fire has communicated itself to some part of a building. If the fire originated in carelessness, however gross, it is not willful fire-raising, but a minor offense, punishable with fine and imprisonment. But if the intention was to injure the proprietor of a tenement by burning, not his house, but an object in its neighborhood—e. g., a haystack—and the fire was accidentally communicated to the house, the offense is the same as if the fire had been applied to the house directly. The infliction of capital punishment for the offense of fire-raising is now in desuetude. When a man burns his own house without endangering the life of any one, he has not committed the crime of fire-raising, but he may be punished criminally, if the act was done for the purpose of defrauding the insurers. Till recently, it was the rule in Scotland, that where fire was the result of inevitable accident, it freed a carrier or innkeeper from responsibility for any goods that were destroyed in his custody, unless where fraud or collusion could be shown; but the law in this respect has been altered by the mercantile law amendment act, 19 and 20 Vict. c. 60, which provides, s. 17, that after the passing of the act (1856), "All carriers for hire, of goods within Scotland, shall be liable to make good to the owner of such goods all losses arising from accidental fire while such goods were in the possession or custody of such carriers"—thus equalizing the law of Scotland with that of England.

Attempting to set fire to houses, crops, etc., is a distinct crime from arson (q.v.), or the actual destruction of property by fire. By 9 and 10 Vict. c. 5, it is enacted, that if any one shall attempt to set fire to a house, etc., with such intent that the offense, if committed, would be felony, and liable to be transported for life, he may be transported for 15 years (now penal servitude), or imprisoned for two years. The attempt to burn growing crops of corn, etc., is a felony by 7 and 8 Geo. IV. c. 30, and punishable by transportation for seven years, or by imprisonment. These offenses are also misdemeanors at common law. By 24 and 25 Vict. c. 97, s. 8, the attempt to set buildings on fire is punishable by penal servitude for fourteen years, or imprisonment for two years; if a male under 16, to be whipped.

In Scotland, an attempt to commit willful fire-raising is an offense at common law. It is not necessary to constitute this offense that the fire should have consumed any part of the building, etc. Furniture—as a mattress—partly consumed, a lighted peat thrust under a stack without igniting it, are sufficient to warrant a conviction. Inciting others to commit fire-raising is an indictable offense; and, in some old cases, persons have been punished for the mere threats to commit the offense, without being guilty of any overt act.

The English act 9 and 10 Vict. c. 25, declares that whoever shall maliciously, by the explosion of gunpowder or other explosive substance, destroy or damage any dwelling-house in which there is any person at the time, is guilty of felony, and shall be subjected to transportation for life, or not less than 15 years, or to an imprisonment not exceeding three years. Blowing up a building with intent to murder, and thereby endangering life, or casting upon any person any explosive or corrosive fluid whereby grievous bodily harm is occasioned him, and similar offenses, are declared subject to the same punishment. Attempting any of these offenses subjects the perpetrator to a minor punishment. The manufacturing or having in possession any explosive substance, or dangerous or noxious thing, or any machine or instrument for the purpose of commiting any of the above offenses, is a misdemeanor, liable to imprisonment not exceeding two years. Male offenders under 18 years of age, convicted under the act, may be whipped.

FIRE-SHIP, a vessel, usually an old one, filled with combustibles, sent in among a hostile squadron, and there fired, in the hope of destroying some of the ships, or at least of producing great confusion. Livy mentions the use of such by the Rhodians, B.C. 190; but among the first occasions in modern times when they are known to have been employed, were by the Dutch in the Scheldt during the war of independence in the Netherlands, and, shortly after, by the English in 1588, against the Spanish armada. The Chinese tried them against the British fleet before Canton in 1857, but unsuccessfully. The service of navigating one of these ships into the midst of an enemy, there firing it, and then attempting to escape, is always fraught with great risk of failure and disaster.

FIRE AND SWORD. By the law of Scotland, though decree may be given in a civil action against an absent defender, no criminal sentence can be pronounced unless the accused be present. But to resist a criminal citation, is to rebel against the law of the land, and in former times might be treated as treason. In this view, letters of *fire and sword* were occasionally issued by the privy council (Stair, iv. 89). These letters were directed to the sheriff of the county, authorizing him to call in the assistance of the

country, and to proceed to the extremities which the terrible words fire and sword indicate, should such proceedings be necessary for apprehending the accused party. Lord Stair describes this remedy as the "last legal execution, warranting all manner of force of arms that is competent in war." The same course might be resorted to where the decree of a court was resisted; and the object with which letters of fire and sword were more frequently issued than any other, was to enable the sheriff to dislodge refractory tenants who retained possession contrary to the order of the judge, or the diligence of the law. By the modern practice, the judge may, of course, always call in the aid of the military to apprehend an accused party, or to enforce a decree where the ordinary means have proved unavailing.

FIRE-WORKS. See PYROTECHNY.

FIRE-WORSHIPERS. See GUEBRES.

FIRISHTA, MOHAMMAD KASIM HINDU SHAH, a celebrated Persian historian, b. towards the end of the 16th c. (1570?), at Astrabad, on the Caspian sea. At a very early age, he went with his father (Gholam Ali Hindu Shah) to India, where we find him, when 12 years old, at Ahmednuggur, in the Deccan, sharing the instruction which the latter gave to prince Miran Hussein Nizam Shah. He afterwards became captain in the body-guard of Murteza Nizam Shah; and when this king was deposed by his own son, F.'s former fellow-student—who, in his own turn, was deposed and murdered in less than a twelvemonth afterwards—F. went to Bijapore (998 H., 1589 A.D.), where Ibrahim Adil Shah II., the reigning monarch, received him with great honor. He also appears to have conferred a military rank upon him, as, soon after his arrival, F. is mentioned as taking part in an action against Jumal Khan, in which he was wounded and taken prisoner, but ere-long he made his escape. His death is supposed to have taken place shortly after the year 1612. His great work is the *Tarikhi Firishta*, or History of the Mohammedan Power in India, which he finished in 1018 H. (1609 A.D.). Twenty years were spent in its preparation, and the number of books used for, and partly embodied in it—special histories of certain periods and provinces—amounts, according to F. himself (introduction), to 35; but 20 others besides these are quoted in the course of the work. It consists—besides a preamble or introduction on the Progress of Mohammedanism in India, and a final treatise on the geography and the climate of India—of 12 divisions, treating of the kings of Ghizni and Lahore, Delhi, the Deccan, Guzerat, Malwah, Candeish, Bengal and Behar, Mooltan, Scinde, Cashmere, Malabar, and of the saints of India. Written with an impartiality, simplicity, and clearness rare in an eastern work, this history has become a standard work on the subject, into which it was the first to enter at length. Single portions of it have been translated by Dow, Scott, Stewart, Anderson, etc.; but the whole work, edited first by J. Briggs (Bombay, 1831, fol. 2 vols.), was also translated by him (London, 1832, 8vo, 4 vols.). A fuller account of F.'s life and writings, by the same, will be found in the second volume of the Transactions of the Asiatic society.

FIRKIN (dim. from *four*, the fourth part of a barrel), an old measure of capacity containing nine gallons (old ale and beer measure). But previous to the year 1803 it had two values, being estimated at eight gallons in old ale measure, and at nine in old beer measure. The F. is equivalent to 9½ imperial gallons. See GALLON.

FIRKOWITSCH, ABRAHAM, 1786–1874; born in the Crimea, of Jewish parents. He became a thorough master of the Hebrew text of the Old Testament, and of many other works, turning his attention particularly to the literature of the Caraites, a religious sect among the Jews. He was instrumental in establishing a printing press for the Caraites of the Crimea, and the reproduction of ancient manuscripts and modern books. In his search for ancient documents, he penetrated the depths of remote Asia, finding many valuable papers not before known to exist, and unintelligible even to their possessors. He was indefatigable in his work, digging over old cellars and searching the nooks of ancient houses, and brought to the imperial library at St. Petersburg 1500 MSS., nearly all of great value.

FIR'LOT (according to Jamieson, from Ang.-Sax. *feorth* and *lot*, the fourth part), an old Scotch dry measure, of which there were four in a boll (q.v.). Though differing in value for different substances and places, its relation to the boll remained invariable. See PECK.

FIRM. See PARTNERSHIP.

FIRMAMENT, a word in use of old to signify the vault of heaven. The term found its way into English from the Vulgate, which renders the Septuagint *Stereoma*, and the Hebrew *Rakia*, by the Latin *Firmamentum* (Gen. i. 6). Rakia (from the verb *raka*, to beat or strike out) signifies whatever is expanded or stretched out, and was specially employed by the Hebrews to denote the hemisphere above the earth, compared (Exod. xxiv. 10) to a splendid and pellucid sapphire. Elsewhere (Ez. i. 22–26) it is spoken of as the "floor" on which the throne of the Most High is placed. Hence it follows that the notions of solidity and expansion were both contained in the Hebrew conception of the firmament. The blue ethereal sky was regarded as a solid crystal sphere, to which the stars were fixed (compare the *cælo affixa sidera* of Pliny, ii. 39 and xviii. 57), and which was constantly revolving, carrying them with it. This sphere or firmament

divided "the waters which were under the firmament from the waters which were above the firmament;" and the theory of the phenomena of rain, etc., was, that there were "windows in heaven"—i.e., in the firmament, through which, when opened, the waters that were above the firmament descended. "The same day were all the fountains of the great deep broken up, and the windows of heaven were opened," Gen. vii. 11. The view entertained by the Greeks, and other early nations, was essentially the same. In the progress of astronomical observations, it was found that many of the heavenly bodies had independent motions, inconsistent with the notion of their being fixed to one sphere or firmament. Then the number of crystalline spheres were indefinitely increased, each body that was clearly independent of the rest having one assigned to it, till a complex system was introduced, capable of being fully understood only by the philosophers who formed it. See PTOLEMAIC SYSTEM. It was long before men formed the idea of the possibility of a body being maintained in motion in space without a fixed support, and considering the number of phenomena of which the hypothesis of a crystalline firmament offered an apparent explanation, we must regard it as having been in its day a curious and ingenious speculation.

FIRMAN, a word of Persian origin, signifies an order, and is used by the Turks to denote any official decree emanating from the Ottoman porte. The right of signing any F. relating to affairs connected with his special department is exercised by every minister and member of the divan, but the office of placing at the head of the F. the *thograï*—a cipher containing the name of the sultan in interlaced letters, and which alone gives effect to the decree—is committed to the hands of a special minister, who is called *nichandji-effendi.* The name applied to such decrees as have been signed by the sultan himself is *hatti-sherif.* The name F. may also signify a more formal kind of Turkish passport, which can only be granted by the sultan or by a pasha.—A written permission to trade is called in India a firman.

FIRMINY, a t. of France, in the dep. of Loire, 6 m. s.w. from St. Etienne, with which it is connected by a branch railway. Near it are rich coal-mines. It is a place of much activity, and has manufactures of silk, glass, and hardwares. Ribbons and nails are among the articles of manufacture most largely produced. Much lamp-black is also made. Pop. '76, 10,101.

FIROLA, a genus of gasteropodous mollusks, of the order *heteropoda*, entirely destitute of shell—although there is a small branchial shell in the nearly allied genus *carinaria;* of a very elongated form, having the mouth situated at the extremity of a proboscis; tentacula wanting, or merely rudimentary; and generally remarkable for great transparency of substance, often enlivened with golden spots. They swim by means of the *foot,* which is compressed into a fin, are often to be seen at the surface of the water in calm weather, and are abundant in the warmer temperate and tropical seas. The oxygenation of the blood is supposed to take place in part through the delicate tissues, as there are no special breathing organs but a ciliated band.

FIROZPUR, or FEROZEPORE, a district in British India in the Lahore division of the lieutenant-governorship of the Punjab, on the river Sutlej; 2,740 sq.m.; pop. '68, 549,253; Mohammedans, 245,659; Hindus, 160,487. The productions are wheat, barley, millet, cotton, tobacco, etc. The Lahore and Ludiana road is the chief route of trade. The chief town is Firozpur, on an old bank of the Sutlej; pop. '68, 20,592. The city is surrounded by a low brick wall, and the main streets are well paved. It is also an important military station.
